Chapter 1. 楔子

幾乎每個 FreeBSD 愛用者都是透過 FreeBSD Ports Collection 來裝各式應用程式("ports")。如同 FreeBSD 的其他部分一樣，這些 ports 都主要來自許多志工的努力成果，所以在讀這份文件時，請務必感恩在心。

在 FreeBSD 上面，任何人都可以提交新的 port，或假如該 port 無人維護的話，可以自願維護 —— 這點並不需要任何 commit 的權限，就可以來做這件事情。
Chapter 2. 製作新的 Port

開始對製作新的 port 或更新現有 port 有一些興趣了？太好！

下面將介紹一些建立 port 時該注意的事項。如果是想升級現有的 port，那也請參看 Upgrading a Port 章節。

因為這份文件可能講得不是十分詳細，可能需要參考 /usr/ports/Mk/bsd.port.mk 這檔是所有 port 的 Makefile 都會用到的。就算不是天天 hacking Makefile，也可以從中獲得很多相關知識。此外，若有其他特定 port 的問題，也可以到 FreeBSD ports mailing list 來獲得答案。

本文所提及的環境變數 (VAR) 部份，只有一些可以替換 (overridden)。大部份的環境變數 (非全部) 通常都會在 /usr/ports/Mk/bsd.port.mk 檔，其他的也是差不多。請注意：該檔せ並非使用一般的 tab 設定，而是採用 1 個 tab 等於 4 個 space。Emacs 與 Vim 應該都會在載入該檔時順便讀取相關設定。vi(1) 及 ex(1) 這兩個程式也都可以打：set tabstop=4 以修改設定。

想要簡單的開始上手？到 請求協助的 ports 清單 詢問看看是否有可以幫上忙的。
Chapter 3. 打造 Port 快速上手篇

本節主要介紹如何來快速打造 port，然而實際應用時這快速方法可能不足，完整的 "慢速打造 Port" 的細節在 Slow Porting 詳述。

首先取得該應用程式的原始程式碼壓縮(tarball)，並把它放到 DISTDIR，預設路徑應該是 /usr/ports/distfiles。

這些步驟假設軟體可以直接編譯。也就是不需要任何修改就可以直接在 FreeBSD 上執行。如果需要修改，請參見 Slow Porting。

It is recommended to set the DEVELOPER make(1) variable in /etc/make.conf before getting into porting.

```
# echo DEVELOPER=yes >> /etc/make.conf
```

This setting enables the "developer mode" that displays deprecation warnings and activates some further quality checks on calling make.

## 3.1. 編× Makefile

最簡單的 Makefile 大概是這樣：

```
# $FreeBSD: head/zh_TW.UTF-8/books/porters-handbook/book.xml 48496 2016-03-29 01:37:53Z kevlo $

PORTNAME= oneko
PORTVERSION= 1.1b
CATEGORIES= games
MAINTAINER= youremail@example.com
COMMENT= Cat chasing a mouse all over the screen

.include <bsd.port.mk>
```

In some cases, the Makefile of an existing port may contain additional lines in the header, such as the name of the port and the date it was created. This additional information has been declared obsolete, and is being phased out.

大致就是這樣，看看已經領略多少了？ 看到 $FreeBSD: head/zh_TW.UTF-8/books/porters-handbook/book.xml 48496 2016-03-29 01:37:53Z kevlo $ 這一行的話，別想太多，當該 port 正式進入 port tree 時，Subversion 就會自動轉換為相×字串。 有關這點的細節部，可以參∫ sample Makefile 章節。
3.2. 撰寫說明

無論是否打算再加工做成 package，有兩個檔案是任何 port 都必須要具備的。這兩個檔案分別是 pkg-descr 及 pkg-plist。他們名前面都有 pkg- 以跟其他檔案做區別。

3.2.1. pkg-descr

這是此 port 的詳細說明，請用一段或幾段文字來說明該 port 的作用

请注意，這種「該軟體的手冊」或是「如何編譯、使用該 port 的明」！
若是從該軟體的 README 或 manpage 描述或格式不合，例如，manpage 會對齊空白，這用 monospace 字型來看會特別糟糕。

A well-written pkg-descr describes the port completely enough that users would not have to consult the documentation or visit the website to understand what the software does, how it can be useful, or what particularly nice features it has. Mentioning certain requirements like a graphical toolkit, heavy dependencies, runtime environment, or implementation languages help users decide whether this port will work for them.

Include a URL to the official WWW homepage. Prepend one of the websites (pick the most common one) with WWW: (followed by single space) so that automated tools will work correctly. If the URI is the root of the website or directory, it must be terminated with a slash.

If the listed webpage for a port is not available, try to search the Internet first to see if the official site moved, was renamed, or is hosted elsewhere.

這是 pkg-descr 的例示:

This is a port of oneko, in which a cat chases a poor mouse all over the screen. :
(etc.)
WWW: http://www.oneko.org/

3.2.2. pkg-plist

這是該 port 所會裝的所有檔案清單，外因為 package 會由這清單所生，因此也被為『packing list (打包清單)』。路徑是相對於安裝的 prefix (通常是 /usr/local)。

這是一個簡單的例子:
於 packing list 方面，可以詳閱 *pkg-create(8)* manual page。

建議清單的檔案，依照字母順序作排序，那下次要升級時，會比較清楚、方便來更新這個清單。

手動產生這個清單實在太苦了。尤其若裝一個 port 會裝一大堆檔案的話，請多善用自動生成 packing list，會比較省時省力。

只有在一種情況下可以省略 pkg-plist ：若安裝的 port 相當單純，只有裝一些檔案，那麼可以在 Makefile 改用 PLIST_FILES 來取代。例如，可以在上述的 oneko port 不必附上 pkg-plist，而只需在 Makefile 加入下列幾行：

```make
PLIST_FILES=   bin/oneko \
               man/man1/oneko.1.gz \
               lib/X11/app-defaults/Oneko \
               lib/X11/oneko/cat1.xpm \
               lib/X11/oneko/cat2.xpm \
               lib/X11/oneko/mouse.xpm
```

Usage of PLIST_FILES should not be abused. When looking for the origin of a file, people usually try to grep through the pkg-plist files in the ports tree. Listing files in PLIST_FILES in the Makefile makes that search more difficult.

If a port needs to create an empty directory, or creates directories outside of ${PREFIX} during installation, refer to Cleaning Up Empty Directories for more information.

然而，使用這個方法列出 port 的檔案和目錄必須付出代價：不能使用 *pkg-create(8)* 和 *Expanding Package List with Keywords* 描述的關鍵字。因此，這招僅適用於較簡單的 port，以及簡化該 port 的作法。此外，這招還有一個好處：可以減少 ports collection 的整體檔案總數。所以，在考慮是否要用 pkg-plist 之前，可以先斟酌這個替代方案看看。

後面會介紹到如何運用 pkg-plist、PLIST_FILES 這些技巧以因應更複雜的狀況。

### 3.3. 產生 checksum

只要打 `make makesum` 就好了，接下來就會自動生成相對應的 distinfo 檔了。
3.4. 測試 Port

接下來，必須檢驗是否有符合 port 的遊戲規則，包括打包該 port 為 package。
以下有幾個需要確認的重要地方：

- 若該 port 沒裝的東西，不要列在 pkg-plist 中。
- 若該 port 有裝的東西，請務必列在 pkg-plist 中。
- The port can be installed using the install target. This verifies that the install script works correctly.
- The port can be deinstalled properly using the deinstall target. This verifies that the deinstall script works correctly.
- The port does not access network resources after the fetch target. This is important for package builders, such as ports-mgmt/poudriere.
- Make sure that make package can be run as a normal user (that is, not as root). If that fails, NEED_ROOT=yes must be added to the port Makefile.

**Procedure:** 建議的測試順序

1. make stage
2. make check-orphans
3. make package
4. make install
5. make deinstall
6. pkg add package-filename
7. make package (as user)

確認在任何階段都沒有任何警告出現。

Thorough automated testing can be done with ports-mgmt/tinderbox or ports-mgmt/poudriere from the Ports Collection. These applications maintain jails where all of the steps shown above can be tested without affecting the state of the host system.

3.5. 以 portlint 來作檢查 Port

請用 portlint 來檢查 port 是否有遵循我們的規則。ports-mgmt/portlint 是 ports collection 的其中一個套件。它主要可以用來驗證 Makefile 內容是否正確以及 package 是否有正確命名。

3.6. 提交新的 Port

提交新的 Port 前，請讀 DOs and DON'Ts 章節。

現在你很高興終於打造出 port 來，唯一剩下要做的就是把它正式放到 FreeBSD ports tree 中，才能讓每個人都能分享使用這個 port。我們不需要工作目錄或是名像 pkgname.tgz 的 package
Next, build the `shar(1)` file. Assuming the port is called `oneko`, `cd` to the directory above where the `oneko` directory is located, and then type: `shar find oneko > oneko.shar`

To submit `oneko.shar`, use the `bug submit form` (category `Ports Tree`). Add a short description of the program to the Description field of the PR (perhaps a short version of `COMMENT`), and do not forget to add `oneko.shar` as an attachment.

Giving a good description in the summary of the problem report makes the work of port committers a lot easier. We prefer something like "New port: `category/portname__short description of the port`" for new ports. Using this scheme makes it easier and faster to begin the work of committing the new port.

再次強調一點：不必附上原始 `source` 的 `distfile`, 也就是 `work` 目錄。同時，也不必附上 `make package` 時產生的 `package`。新的 `port` 請使用 `shar(1)`，不要用 `diff(1)`。

送出 `port` 之後，請耐心等候佳音。有時候可能需要等個幾天或幾個月時間，才會在 FreeBSD ports tree 上正式出現。等待中的 `port` PR 清單可以在 `http://www.FreeBSD.org/cgi/query-pr-summary.cgi?category=ports` 查閱。

在看過新的 `port` 之後，如果需要的話，我們會回覆，然後會將它提交到 `port tree`。`port` 的大名會被列在 `Additional FreeBSD Contributors` 列表上，以及其他案中。
Chapter 4. Slow Porting

Ok...事實上並不太可能這回事，port 方面可能需要作些修改才能正常使用。因此，本節將一章一章來介紹如何修改上一章的樣本以正常使用。

4.1. How Things Work

First, this is the sequence of events which occurs when the user first types `make` in the port's directory. Having `bsd.port.mk` in another window while reading this really helps to understand it.

別太擔心，不是很多人都真的了解 `bsd.port.mk` 在做什麼... :-(

1. The `fetch` target is run. The `fetch` target is responsible for making sure that the tarball exists locally in `DISTDIR`. If `fetch` cannot find the required files in `DISTDIR` it will look up the URL `MASTER_SITES`, which is set in the Makefile, as well as our FTP mirrors where we put distfiles as backup. It will then attempt to fetch the named distribution file with `FETCH`, assuming that the requesting site has direct access to the Internet. If that succeeds, it will save the file in `DISTDIR` for future use and proceed.

2. The `extract` target is run. It looks for the port's distribution file (typically a compressed tarball) in `DISTDIR` and unpacks it into a temporary subdirectory specified by `WRKDIR` (defaults to work).

3. The `patch` target is run. First, any patches defined in `PATCHFILES` are applied. Second, if any patch files named `patch-*` are found in `PATCHDIR` (defaults to the files subdirectory), they are applied at this time in alphabetical order.

4. The `configure` target is run. This can do any one of many different things.
   a. If it exists, scripts/configure is run.
   b. If `HAS_CONFIGURE` or `GNU_CONFIGURE` is set, `WRKDIR/configure` is run.

5. The `build` target is run. This is responsible for descending into the port's private working directory (`WRKDIR`) and building it.

6. The `stage` target is run. This puts the final set of built files into a temporary directory (`STAGEDIR`, see Staging). The hierarchy of this directory mirrors that of the system on which the package will be installed.

7. The `package` target is run. This creates a package using the files from the temporary directory created during the `stage` target and the port's pkg-plist.

8. The `install` target is run. This installs the package created during the `package` target into the host system.

The above are the default actions. In addition, define targets `pre-something` or `post-something`, or put scripts with those names, in the scripts subdirectory, and they will be run before or after the default actions are done.

For example, if there is a `post-extract` target defined in the Makefile, and a file `pre-build` in the scripts subdirectory, the `post-extract` target will be called after the regular extraction actions, and
pre-build will be executed before the default build rules are done. It is recommended to use Makefile targets if the actions are simple enough, because it will be easier for someone to figure out what kind of non-default action the port requires.

The default actions are done by the do-something targets from bsd.port.mk. For example, the commands to extract a port are in the target do-extract. If the default target does not do the job right, redefine the do-something target in the Makefile.

The "main" targets (for example, extract, configure, etc.) do nothing more than make sure all the stages up to that one are completed and call the real targets or scripts, and they are not intended to be changed. To fix the extraction, fix do-extract, but never ever change the way extract operates! Additionally, the target post-deinstall is invalid and is not run by the ports infrastructure.

Now that what goes on when the user types make install is better understood, let us go through the recommended steps to create the perfect port.

4.2. 取得原始碼

Get the original sources (normally) as a compressed tarball (foo.tar.gz or foo.tar.bz2) and copy it into DISTDIR. Always use mainstream sources when and where possible.

Set the variable MASTER_SITES to reflect where the original tarball resides. Shorthand definitions exist for most mainstream sites in bsd.sites.mk. Please use these sites-and the associated definitions-if at all possible, to help avoid the problem of having the same information repeated over again many times in the source base. As these sites tend to change over time, this becomes a maintenance nightmare for everyone involved. See MASTER_SITES for details.

If there is no FTP/HTTP site that is well-connected to the net, or can only find sites that have irritatingly non-standard formats, put a copy on a reliable FTP or HTTP server (for example, a home page).

If a convenient and reliable place to put the distfile cannot be found, we can "house" it ourselves on ftp.FreeBSD.org; however, this is the least-preferred solution. The distfile must be placed into ~/public_distfiles/ of someone’s freefall account. Ask the person who commits the port to do this. This person will also set MASTER_SITES to LOCAL/username where username is their FreeBSD cluster login.

If the port's distfile changes all the time without any kind of version update by the author, consider putting the distfile on a home page and listing it as the first MASTER_SITES. Try to talk the port author out of doing this; it really does help to establish some kind of source code control. Hosting a specific version will prevent users from getting checksum mismatch errors, and also reduce the workload of maintainers of our FTP site. Also, if there is only one master site for the port, it is recommended to house a backup on a home page and list it as the second MASTER_SITES.

If the port requires additional patches that are available on the Internet, fetch them too and put them in DISTDIR. Do not worry if they come from a site other than where the main source tarball comes, we have a way to handle these situations (see the description of PATCHFILES below).
4.3. Modifying the Port

Unpack a copy of the tarball in a private directory and make whatever changes are necessary to get the port to compile properly under the current version of FreeBSD. Keep careful track of steps, as they will be needed to automate the process shortly. Everything, including the deletion, addition, or modification of files has to be doable using an automated script or patch file when the port is finished.

If the port requires significant user interaction/customization to compile or install, take a look at one of Larry Wall's classic Configure scripts and perhaps do something similar. The goal of the new ports collection is to make each port as "plug-and-play" as possible for the end-user while using a minimum of disk space.

Unless explicitly stated, patch files, scripts, and other files created and contributed to the FreeBSD ports collection are assumed to be covered by the standard BSD copyright conditions.

4.4. Patching

In the preparation of the port, files that have been added or changed can be recorded with diff(1) for later feeding to patch(1). Doing this with a typical file involves saving a copy of the original file before making any changes using a .orig suffix.

% cp file file.orig

After all changes have been made, cd back to the port directory. Use make makepatch to generate updated patch files in the files directory.

Use BINARY_ALIAS to substitute hardcoded commands during the build and avoid patching build files. See Use BINARY_ALIAS to Rename Commands Instead of Patching the Build for more information.

4.4.1. General Rules for Patching

Patch files are stored in PATCHDIR, usually files/, from where they will be automatically applied. All patches must be relative to WRKSRC. Typically WRKSRC is a subdirectory of WRKDIR, the directory where the distfile is extracted. Use make -V WRKSRC to see the actual path. The patch names are to follow these rules:

- Avoid having more than one patch modify the same file. For example, having both patch-foobar.c and patch-foobar.c2 making changes to ${WRKSRC}/foobar.c makes them fragile and difficult to debug.
- When creating names for patch files, replace each underscore (_) with two underscores (___) and each slash (/) with one underscore (_). For example, to patch a file named src/freeglut_joystick.c, name the corresponding patch patch-src_freeglut__joystick.c. Do not name patches like patch-aa or patch-ab. Always use the path and file name in patch names. Using make makepatch
automatically generates the correct names.

- A patch may modify multiple files if the changes are related and the patch is named appropriately. For example, patch-add-missing-stdlib.h.

- Only use characters [-+_.a-zA-Z0-9] for naming patches. In particular, do not use :: as a path separator, use _ instead.

Minimize the amount of non-functional whitespace changes in patches. It is common in the Open Source world for projects to share large amounts of a code base, but obey different style and indenting rules. When taking a working piece of functionality from one project to fix similar areas in another, please be careful: the resulting patch may be full of non-functional changes. It not only increases the size of the ports repository but makes it hard to find out what exactly caused the problem and what was changed at all.

If a file must be deleted, do it in the post-extract target rather than as part of the patch.

### 4.4.2. Manual Patch Generation

Manual patch creation is usually not necessary. Automatic patch generation as described earlier in this section is the preferred method. However, manual patching may be required occasionally.

Patches are saved into files named patch-* where * indicates the pathname of the file that is patched, such as patch-Imakefile or patch-src-config.h.

After the file has been modified, `diff(1)` is used to record the differences between the original and the modified version. `-u` causes `diff(1)` to produce "unified" diffs, the preferred form.

```
% diff -u file.orig file > patch-pathname-file
```

When generating patches for new, added files, `-N` is used to tell `diff(1)` to treat the non-existent original file as if it existed but was empty:

```
% diff -u -N newfile.orig newfile > patch-pathname-newfile
```

Do not add `$FreeBSD$` RCS strings in patches. When patches are added to the Subversion repository with `svn add`, the `fbsd:nokeywords` property is set to `yes` automatically so keywords in the patch are not modified when committed. The property can be added manually with `svn propset fbsd:nokeywords yes files...`.

Using the recurse (-r) option to `diff(1)` to generate patches is fine, but please look at the resulting patches to make sure there is no unnecessary junk in there. In particular, diffs between two backup files, Makefiles when the port uses `Imake` or GNU `configure`, etc., are unnecessary and have to be deleted. If it was necessary to edit `configure.in` and run `autoconf` to regenerate `configure`, do not take the diffs of `configure` (it often grows to a few thousand lines!). Instead, define `USES=autoreconf` and take the diffs of `configure.in`.
4.4.3. Simple Automatic Replacements

Simple replacements can be performed directly from the port Makefile using the in-place mode of `sed(1)`. This is useful when changes use the value of a variable:

```
post-patch:
  @${REINPLACE_CMD} -e 's|/usr/local/${PREFIX}|g' ${WRKSRC}/Makefile
```

Only use `sed(1)` to replace variable content. You must use patch files instead of `sed(1)` to replace static content.

Quite often, software being ported uses the CR/LF convention in source files. This may cause problems with further patching, compiler warnings, or script execution (like `/bin/sh^M not found`). To quickly convert all files from CR/LF to just LF, add this entry to the port Makefile:

```
USES=   dos2unix
```

A list of specific files to convert can be given:

```
USES=   dos2unix
DOS2UNIX_FILES= util.c util.h
```

Use `DOS2UNIX_REGEX` to convert a group of files across subdirectories. Its argument is a `find(1)`-compatible regular expression. More on the format is in `re_format(7)`. This option is useful for converting all files of a given extension. For example, convert all source code files, leaving binary files intact:

```
USES=   dos2unix
DOS2UNIX_REGEX= .*\.(\[ch\]|cpp)
```

A similar option is `DOS2UNIX_GLOB`, which runs `find` for each element listed in it.

```
USES=   dos2unix
DOS2UNIX_GLOB=  *.c *.cpp *.h
```

The base directory for the conversion can be set. This is useful when there are multiple distfiles and several contain files which require line-ending conversion.

```
USES=   dos2unix
DOS2UNIX_WRKDIR= ${WRKDIR}
```
### 4.4.4. Patching Conditionally

Some ports need patches that are only applied for specific FreeBSD versions or when a particular option is enabled or disabled. Conditional patches are specified by placing the full paths to the patch files in `EXTRA_PATCHES`.

#### 例 1. Applying a Patch for a Specific FreeBSD Version

```bash
.include <bsd.port.options.mk>

# Patch in the iconv const qualifier before this
.if ${OPSYS} == FreeBSD && ${OSVERSION} < 1100069
EXTRA_PATCHES=   ${PATCHDIR}/extra-patch-fbsd10
.endif

.include <bsd.port.mk>
```

#### 例 2. Optionally Applying a Patch

When an option requires a patch, use `opt_EXTRA_PATCHES` and `opt_EXTRA_PATCHES_OFF` to make the patch conditional on the `opt` option. See Generic Variables Replacement for more information.

```bash
OPTIONS_DEFINE=   FOO BAR
FOO_EXTRA_PATCHES=  ${PATCHDIR}/extra-patch-foo
BAR_EXTRA_PATCHES_OFF=  ${PATCHDIR}/extra-patch-bar.c \
                         ${PATCHDIR}/extra-patch-bar.h
```
Sometime, there are many patches that are needed for a feature, in this case, it is possible to point `EXTRA_PATCHES` to a directory, and it will automatically apply all files named `patch-*` in it.

Create a subdirectory in `${PATCHDIR}`, and move the patches in it. For example:

```
% ls -l files/foo-patches
-rw-r--r-- 1 root  wheel   350 Jan 16 01:27 patch-Makefile.in
-rw-r--r-- 1 root  wheel   3084 Jan 18 15:37 patch-configure
```

Then add this to the `Makefile`:

```
OPTIONS_DEFINE= FOO
FOO_EXTRA_PATCHES= ${PATCHDIR}/foo-patches
```

The framework will then use all the files named `patch-*` in that directory.

### 4.5. 設定

Include any additional customization commands in the `configure` script and save it in the `scripts` subdirectory. As mentioned above, it is also possible do this with `Makefile` targets and/or scripts with the name `pre-configure` or `post-configure`.

### 4.6. 處理使用者輸入

If the port requires user input to build, configure, or install, set `IS_INTERACTIVE` in the `Makefile`. This will allow "overnight builds" to skip it. If the user sets the variable `BATCH` in their environment (and if the user sets the variable `INTERACTIVE`, then only those ports requiring interaction are built). This will save a lot of wasted time on the set of machines that continually build ports (see below).

It is also recommended that if there are reasonable default answers to the questions, `PACKAGE_BUILDING` be used to turn off the interactive script when it is set. This will allow us to build the packages for CDROMs and FTP.
Chapter 5. Configuring the Makefile

Configuring the Makefile is pretty simple, and again we suggest looking at existing examples before starting. Also, there is a sample Makefile in this handbook, so take a look and please follow the ordering of variables and sections in that template to make the port easier for others to read.

Consider these problems in sequence during the design of the new Makefile:

5.1. The Original Source

Does it live in DISTDIR as a standard gzipped tarball named something like foozolix-1.2.tar.gz? If so, go on to the next step. If not, the distribution file format might require overriding one or more of DISTVERSION, DISTNAME, EXTRACT_CMD, EXTRACT_BEFORE_ARGS, EXTRACT_AFTER_ARGS, EXTRACT_SUFX, or DISTFILES.

In the worst case, create a custom do-extract target to override the default. This is rarely, if ever, necessary.

5.2. Naming

The first part of the port’s Makefile names the port, describes its version number, and lists it in the correct category.

5.2.1. PORTNAME

Set PORTNAME to the base name of the software. It is used as the base for the FreeBSD package, and for DISTNAME.

The package name must be unique across the entire ports tree. Make sure that the PORTNAME is not already in use by an existing port, and that no other port already has the same PKGBASE. If the name has already been used, add either PKGNAMESPACEPREFIX or PKGNAMESUFFIX.

5.2.2. Versions, DISTVERSION or PORTVERSION

Set DISTVERSION to the version number of the software.

PORTVERSION is the version used for the FreeBSD package. It will be automatically derived from DISTVERSION to be compatible with FreeBSD’s package versioning scheme. If the version contains letters, it might be needed to set PORTVERSION and not DISTVERSION.

Only one of PORTVERSION and DISTVERSION can be set at a time.

From time to time, some software will use a version scheme that is not compatible with how DISTVERSION translates in PORTVERSION.
When updating a port, it is possible to use `pkg-version(8)`'s `-t` argument to check if the new version is greater or lesser than before. See Using `pkg-version(8)` to Compare Versions.

**Example 4. Using `pkg-version(8)` to Compare Versions**

`pkg version -t` takes two versions as arguments, it will respond with `<, = or >` if the first version is less, equal, or more than the second version, respectively.

```
% pkg version -t 1.2 1.3
< ①
% pkg version -t 1.2 1.2
= ②
% pkg version -t 1.2 1.2.0
= ③
% pkg version -t 1.2 1.2.p1
> ④
% pkg version -t 1.2.a1 1.2.b1
< ⑤
% pkg version -t 1.2 1.2p1
< ⑥
```

① 1.2 is before 1.3.
② 1.2 and 1.2 are equal as they have the same version.
③ 1.2 and 1.2.0 are equal as nothing equals zero.
④ 1.2 is after 1.2.p1 as .p1, think "pre-release 1".
⑤ 1.2.a1 is before 1.2.b1, think "alpha" and "beta", and a is before b.
⑥ 1.2 is before 1.2p1 as 2p1, think "2, patch level 1" which is a version after any 2.X but before 3.

In here, the a, b, and p are used as if meaning "alpha", "beta" or "pre-release" and "patch level", but they are only letters and are sorted alphabetically, so any letter can be used, and they will be sorted appropriately.

<table>
<thead>
<tr>
<th>DISTVERSION</th>
<th>PORTVERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.7.1d</td>
<td>0.7.1.d</td>
</tr>
<tr>
<td>10Alpha3</td>
<td>10.a3</td>
</tr>
<tr>
<td>3Beta7-pre2</td>
<td>3.b7.p2</td>
</tr>
</tbody>
</table>
5. Using \texttt{DISTVERSION}

When the version only contains numbers separated by dots, dashes or underscores, use \texttt{DISTVERSION}.

```
PORTNAME= nekoto
DISTVERSION= 1.2-4
```

It will generate a \texttt{PORTVERSION} of 1.2.4.
When the version starts or ends with a letter, or a prefix or a suffix that is not part of the version, use `DISTVERSIONPREFIX`, `DISTVERSION`, and `DISTVERSIONSUFFIX`.

If the version is `v1.2-4`:

```plaintext
PORTNAME=  nekoto
DISTVERSIONPREFIX=  v
DISTVERSION=    1_2_4
```

Some of the time, projects using GitHub will use their name in their versions. For example, the version could be `nekoto-1.2-4`:

```plaintext
PORTNAME=  nekoto
DISTVERSIONPREFIX=  nekoto-
DISTVERSION=    1.2_4
```

Those projects also sometimes use some string at the end of the version, for example, `1.2-4_RELEASE`:

```plaintext
PORTNAME=  nekoto
DISTVERSION=    1.2-4
DISTVERSIONSUFFIX=  _RELEASE
```

Or they do both, for example, `nekoto-1.2-4_RELEASE`:

```plaintext
PORTNAME=  nekoto
DISTVERSIONPREFIX=  nekoto-
DISTVERSION=    1.2-4
DISTVERSIONSUFFIX=  _RELEASE
```

`DISTVERSIONPREFIX` and `DISTVERSIONSUFFIX` will not be used while constructing `PORTVERSION`, but only used in `DISTNAME`.

All will generate a `PORTVERSION` of `1.2.4`. 
**Example 7. Using DISTVERSION When the Version Contains Letters Meaning "alpha", "beta", or "pre-release"**

When the version contains numbers separated by dots, dashes or underscores, and letters are used to mean "alpha", "beta" or "pre-release", which is, before the version without the letters, use `DISTVERSION`.

```
PORTNAME= nekoto
DISTVERSION= 1.2-pre4
```

```
PORTNAME= nekoto
DISTVERSION= 1.2p4
```

Both will generate a `PORTVERSION` of `1.2.p4` which is before than 1.2. `pkg-version(8)` can be used to check that fact:

```
% pkg version -t 1.2.p4 1.2
<
```

**Example 8. Not Using DISTVERSION When the Version Contains Letters Meaning "Patch Level"**

When the version contains letters that are not meant as "alpha", "beta", or "pre", but more in a "patch level", and meaning after the version without the letters, use `PORTVERSION`.

```
PORTNAME= nekoto
PORTVERSION= 1.2p4
```

In this case, using `DISTVERSION` is not possible because it would generate a version of `1.2.p4` which would be before `1.2` and not after. `pkg-version(8)` will verify this:

```
% pkg version -t 1.2 1.2.p4
> ①
% pkg version -t 1.2 1.2p4
< ②
```

① `1.2` is after `1.2.p4`, which is *wrong* in this case.

② `1.2` is before `1.2p4`, which is what was needed.

For some more advanced examples of setting `PORTVERSION`, when the software's versioning is really not compatible with FreeBSD's, or `DISTNAME` when the distribution file does not contain the version itself, see `DISTNAME`. 

---

26
5.2.3. **PORTREVISION** and **PORTEPOCH**

### 5.2.3.1. PORTREVISION

**PORTREVISION** is a monotonically increasing value which is reset to 0 with every increase of **DISTVERSION**, typically every time there is a new official vendor release. If **PORTREVISION** is non-zero, the value is appended to the package name. Changes to **PORTREVISION** are used by automated tools like `pkg-version(8)` to determine that a new package is available.

**PORTREVISION** must be increased each time a change is made to the port that changes the generated package in any way. That includes changes that only affect a package built with non-default options.

Examples of when **PORTREVISION** must be bumped:

- Addition of patches to correct security vulnerabilities, bugs, or to add new functionality to the port.
- Changes to the port Makefile to enable or disable compile-time options in the package.
- Changes in the packing list or the install-time behavior of the package. For example, a change to a script which generates initial data for the package, like `ssh(1)` host keys.
- Version bump of a port's shared library dependency (in this case, someone trying to install the old package after installing a newer version of the dependency will fail since it will look for the old libfoo.x instead of libfoo.(x+1)).
- Silent changes to the port distfile which have significant functional differences. For example, changes to the distfile requiring a correction to distinfo with no corresponding change to **DISTVERSION**, where a `diff -ru` of the old and new versions shows non-trivial changes to the code.

Examples of changes which do not require a **PORTREVISION** bump:

- Style changes to the port skeleton with no functional change to what appears in the resulting package.
- Changes to **MASTER_SITES** or other functional changes to the port which do not affect the resulting package.
- Trivial patches to the distfile such as correction of typos, which are not important enough that users of the package have to go to the trouble of upgrading.
- Build fixes which cause a package to become compilable where it was previously failing. As long as the changes do not introduce any functional change on any other platforms on which the port did previously build. Since **PORTREVISION** reflects the content of the package, if the package was not previously buildable then there is no need to increase **PORTREVISION** to mark a change.

A rule of thumb is to decide whether a change committed to a port is something which some people would benefit from having. Either because of an enhancement, fix, or by virtue that the new package will actually work at all. Then weigh that against that fact that it will cause everyone who regularly updates their ports tree to be compelled to update. If yes, **PORTREVISION** must be bumped.
People using binary packages will never see the update if `PORTREVISION` is not bumped. Without increasing `PORTREVISION`, the package builders have no way to detect the change and thus, will not rebuild the package.

### 5.2.3.2. `PORTEPOCH`

From time to time a software vendor or FreeBSD porter will do something silly and release a version of their software which is actually numerically less than the previous version. An example of this is a port which goes from `foo-20000801` to `foo-1.0` (the former will be incorrectly treated as a newer version since `20000801` is a numerically greater value than `1`).

The results of version number comparisons are not always obvious. `pkg version` (see `pkg-version(8)`) can be used to test the comparison of two version number strings. For example:

```
% pkg version -t 0.031 0.29
>
```

The `>` output indicates that version `0.031` is considered greater than version `0.29`, which may not have been obvious to the porter.

In situations such as this, `PORTEPOCH` must be increased. If `PORTEPOCH` is nonzero it is appended to the package name as described in section 0 above. `PORTEPOCH` must never be decreased or reset to zero, because that would cause comparison to a package from an earlier epoch to fail. For example, the package would not be detected as out of date. The new version number, `1.0,1` in the above example, is still numerically less than the previous version, `20000801`, but the `,1` suffix is treated specially by automated tools and found to be greater than the implied suffix `,0` on the earlier package.

Dropping or resetting `PORTEPOCH` incorrectly leads to no end of grief. If the discussion above was not clear enough, please consult the FreeBSD ports 郵遞論壇.

It is expected that `PORTEPOCH` will not be used for the majority of ports, and that sensible use of `DISTVERSION`, or that use `PORTVERSION` carefully, can often preempt it becoming necessary if a future release of the software changes the version structure. However, care is needed by FreeBSD porters when a vendor release is made without an official version number - such as a code "snapshot" release. The temptation is to label the release with the release date, which will cause problems as in the example above when a new "official" release is made.

For example, if a snapshot release is made on the date `20000917`, and the previous version of the software was version `1.2`, do not use `20000917` for `DISTVERSION`. The correct way is a `DISTVERSION` of `1.2.20000917`, or similar, so that the succeeding release, say `1.3`, is still a numerically greater value.

### 5.2.3.3. Example of `PORTREVISION` and `PORTEPOCH` Usage

The `gtkmumble` port, version `0.10`, is committed to the ports collection:
PORTNAME= gtkmumble
DISTVERSION= 0.10

PKGNAME becomes gtkmumble-0.10.

A security hole is discovered which requires a local FreeBSD patch. PORTREVISION is bumped accordingly.

PORTREVISION= 1

PKGNAME becomes gtkmumble-0.10_1

A new version is released by the vendor, numbered 0.2 (it turns out the author actually intended 0.10 to actually mean 0.1.0, not "what comes after 0.9" - oops, too late now). Since the new minor version 2 is numerically less than the previous version 10, PORTEPOCH must be bumped to manually force the new package to be detected as "newer". Since it is a new vendor release of the code, PORTREVISION is reset to 0 (or removed from the Makefile).

PORTREVISION= 0

PKGNAME becomes gtkmumble-0.2,1

The next release is 0.3. Since PORTEPOCH never decreases, the version variables are now:

PORTREVISION= 1

PKGNAME becomes gtkmumble-0.3,1

If PORTEPOCH were reset to 0 with this upgrade, someone who had installed the gtkmumble-0.10_1 package would not detect the gtkmumble-0.3 package as newer, since 3 is still numerically less than 10. Remember, this is the whole point of PORTEPOCH in the first place.

5.2.4. PKGNAMEPREFIX and PKGNAMESUFFIX

Two optional variables, PKGNAMEPREFIX and PKGNAMESUFFIX, are combined with PORTNAME and PORTVERSION to form PKGNAME as ${PKGNAMEPREFIX}${PORTNAME}${PKGNAMESUFFIX}-${PORTVERSION}. Make sure this conforms to our guidelines for a good package name. In particular, the use of a hyphen (-) in PORTVERSION is not allowed. Also, if the package name has the language- or the -compiled.specif...
part (see below), use {PKGNAMEPREFIX} and {PKGNAMESUFFIX}, respectively. Do not make them part of {PORTNAME}.

5.2.5. Package Naming Conventions

These are the conventions to follow when naming packages. This is to make the package directory easy to scan, as there are already thousands of packages and users are going to turn away if they hurt their eyes!

Package names take the form of language_region-name-compiled.specifics-version.numbers.

The package name is defined as {PKGNAMEPREFIX}{PORTNAME}{PKGNAMESUFFIX}-${PORTVERSION}. Make sure to set the variables to conform to that format.

**language_region-**

FreeBSD strives to support the native language of its users. The language- part is a two letter abbreviation of the natural language defined by ISO-639 when the port is specific to a certain language. Examples are ja for Japanese, ru for Russian, vi for Vietnamese, zh for Chinese, ko for Korean and de for German.

If the port is specific to a certain region within the language area, add the two letter country code as well. Examples are en_US for US English and fr_CH for Swiss French.

The language- part is set in {PKGNAMEPREFIX}.

**name**

Make sure that the port’s name and version are clearly separated and placed into {PORTNAME} and {DISTVERSION}. The only reason for {PORTNAME} to contain a version part is if the upstream distribution is really named that way, as in the textproc/libxml2 or japanese/input2-freewnn ports. Otherwise, {PORTNAME} cannot contain any version-specific information. It is quite normal for several ports to have the same {PORTNAME}, as the www/apache* ports do; in that case, different versions (and different index entries) are distinguished by {PKGNAMEPREFIX} and {PKGNAMESUFFIX} values.

There is a tradition of naming Perl 5 modules by prepending p5- and converting the double-colon separator to a hyphen. For example, the Data::Dumper module becomes p5-Data-Dumper.

**-compiled.specifics**

If the port can be built with different hardcoded defaults (usually part of the directory name in a family of ports), the -compiled.specifics part states the compiled-in defaults. The hyphen is optional. Examples are paper size and font units.

The -compiled.specifics part is set in {PKGNAMESUFFIX}.

**-version.numbers**

The version string follows a dash (\-) and is a period-separated list of integers and single lowercase alphabetics. In particular, it is not permissible to have another dash inside the version string. The only exception is the string pl (meaning “patchlevel”), which can be used only when there are no major and minor version numbers in the software. If the software version has
strings like "alpha", "beta", "rc", or "pre", take the first letter and put it immediately after a period. If the version string continues after those names, the numbers follow the single alphabet without an extra period between them (for example, 1.0b2).

The idea is to make it easier to sort ports by looking at the version string. In particular, make sure version number components are always delimited by a period, and if the date is part of the string, use the dyyyy.mm.dd format, not dd.mm.yyyy or the non-Y2K compliant yy.mm.dd format. It is important to prefix the version with a letter, here d (for date), in case a release with an actual version number is made, which would be numerically less than yyyy.

Package name must be unique among all of the ports tree, check that there is not already a port with the same PORTNAME and if there is add one of PKGNAMEPREFIX or PKGNAMESUFFIX.

Here are some (real) examples on how to convert the name as called by the software authors to a suitable package name, for each line, only one of DISTVERSION or PORTVERSION is set in, depending on which would be used in the port's Makefile:

### Package Naming Examples

</tbody>
</table>

If there is absolutely no trace of version information in the original source and it is unlikely that the original author will ever release another version, just set the version string to 1.0 (like the piewm example above). Otherwise, ask the original author or use the date string the source file was released on (dyyyy.mm.dd, or dyyyyymmd) as the version.

Use any letter. Here, d here stands for date, if the source is a Git repository, g followed by the commit date is commonly used, using s for snapshot is also common.

5.3. Categorization
5.3.1. CATEGORIES

When a package is created, it is put under `/usr/ports/packages/All` and links are made from one or more subdirectories of `/usr/ports/packages`. The names of these subdirectories are specified by the variable `CATEGORIES`. It is intended to make life easier for the user when he is wading through the pile of packages on the FTP site or the CDROM. Please take a look at the current list of categories and pick the ones that are suitable for the port.

This list also determines where in the ports tree the port is imported. If there is more than one category here, the port files must be put in the subdirectory with the name of the first category. See below for more discussion about how to pick the right categories.

5.3.2. Current List of Categories

Here is the current list of port categories. Those marked with an asterisk (*) are virtual categories—those that do not have a corresponding subdirectory in the ports tree. They are only used as secondary categories, and only for search purposes.

For non-virtual categories, there is a one-line description in `COMMENT` in that subdirectory's Makefile.

### 5.3.3. Choosing the Right Category

As many of the categories overlap, choosing which of the categories will be the primary category of the port can be tedious. There are several rules that govern this issue. Here is the list of priorities, in decreasing order of precedence:

- The first category must be a physical category (see above). This is necessary to make the packaging work. Virtual categories and physical categories may be intermixed after that.

- Language specific categories always come first. For example, if the port installs Japanese X11 fonts, then the `CATEGORIES` line would read `japanese x11-fonts`.

- Specific categories are listed before less-specific ones. For instance, an HTML editor is listed as `www editors`, not the other way around. Also, do not list `net` when the port belongs to any of `irc`, `mail`, `news`, or `www`, as `net` is included implicitly.

- `x11` is used as a secondary category only when the primary category is a natural language. In particular, do not put `x11` in the category line for X applications.

- Emacs modes are placed in the same ports category as the application supported by the mode, not in editors. For example, an Emacs mode to edit source files of some programming language goes into `lang`.

- Ports installing loadable kernel modules also have the virtual category `kld` in their `CATEGORIES` line. This is one of the things handled automatically by adding `USES=kmod`.

- `misc` does not appear with any other non-virtual category. If there is `misc` with something else in `CATEGORIES`, that means `misc` can safely be deleted and the port placed only in the other subdirectory.

- If the port truly does not belong anywhere else, put it in `misc`.

If the category is not clearly defined, please put a comment to that effect in the `port submission` in the bug database so we can discuss it before we import it. As a committer, send a note to the FreeBSD ports 郵論壇 so we can discuss it first. Too often, new ports are imported to the wrong category only to be moved right away.

### 5.3.4. Proposing a New Category

As the Ports Collection has grown over time, various new categories have been introduced. New categories can either be virtual categories-those that do not have a corresponding subdirectory in the ports tree- or physical categories-those that do. This section discusses the issues involved in creating a new physical category. Read it thoroughly before proposing a new one.

Our existing practice has been to avoid creating a new physical category unless either a large
number of ports would logically belong to it, or the ports that would belong to it are a logically distinct group that is of limited general interest (for instance, categories related to spoken human languages), or preferably both.

The rationale for this is that such a change creates a fair amount of work for both the committers and also for all users who track changes to the Ports Collection. In addition, proposed category changes just naturally seem to attract controversy. (Perhaps this is because there is no clear consensus on when a category is “too big”, nor whether categories should lend themselves to browsing (and thus what number of categories would be an ideal number), and so forth.)

Here is the procedure:

1. Propose the new category on FreeBSD ports. Include a detailed rationale for the new category, including why the existing categories are not sufficient, and the list of existing ports proposed to move. (If there are new ports pending in Bugzilla that would fit this category, list them too.) If you are the maintainer and/or submitter, respectively, mention that as it may help the case.

2. Participate in the discussion.

3. If it seems that there is support for the idea, file a PR which includes both the rationale and the list of existing ports that need to be moved. Ideally, this PR would also include these patches:
   ◦ Makefiles for the new ports once they are repocopied
   ◦ Makefile for the new category
   ◦ Makefile for the old ports’ categories
   ◦ Makefiles for ports that depend on the old ports
   ◦ (for extra credit, include the other files that have to change, as per the procedure in the Committer’s Guide.)

4. Since it affects the ports infrastructure and involves moving and patching many ports but also possibly running regression tests on the build cluster, assign the PR to the Ports Management Team <portmgr@FreeBSD.org>.

5. If that PR is approved, a committer will need to follow the rest of the procedure that is outlined in the Committer’s Guide.

Proposing a new virtual category is similar to the above but much less involved, since no ports will actually have to move. In this case, the only patches to include in the PR would be those to add the new category to CATEGORIES of the affected ports.

5.3.5. Proposing Reorganizing All the Categories

Occasionally someone proposes reorganizing the categories with either a 2-level structure, or some other kind of keyword structure. To date, nothing has come of any of these proposals because, while they are very easy to make, the effort involved to retrofit the entire existing ports collection with any kind of reorganization is daunting to say the very least. Please read the history of these proposals in the mailing list archives before posting this idea. Furthermore, be prepared to be challenged to offer a working prototype.
5.4. The Distribution Files

The second part of the Makefile describes the files that must be downloaded to build the port, and where they can be downloaded.

5.4.1. DISTNAME

DISTNAME is the name of the port as called by the authors of the software. DISTNAME defaults to 
${PORTNAME}-${DISTVERSIONPREFIX}${DISTVERSION}${DISTVERSIONSUFFIX}, and if not set, DISTVERSION defaults to 
${PORTVERSION} so override DISTNAME only if necessary. DISTNAME is only used in two places.
First, the distribution file list (DISTFILES) defaults to 
${DISTNAME}${EXTRACT_SUFX}. Second, the distribution file is expected to extract into a subdirectory named 
WRKSRC, which defaults to work/${DISTNAME}.

Some vendor’s distribution names which do not fit into the 
${PORTNAME}-${PORTVERSION}-scheme can 
be handled automatically by setting DISTVERSIONPREFIX, DISTVERSION, and DISTVERSIONSUFFIX. 
PORTVERSION will be derived from DISTVERSION automatically.

⚠️ Only one of PORTVERSION and DISTVERSION can be set at a time. If DISTVERSION does not derive a correct PORTVERSION, do not use DISTVERSION.

If the upstream version scheme can be derived into a ports-compatible version scheme, set some variable to the upstream version, do not use DISTVERSION as the variable name. Set PORTVERSION to the computed version based on the variable you created, and set DISTNAME accordingly.

If the upstream version scheme cannot easily be coerced into a ports-compatible value, set 
PORTVERSION to a sensible value, and set DISTNAME with PORTNAME with the verbatim upstream version.
BIND9 uses a version scheme that is not compatible with the ports versions (it has - in its versions) and cannot be derived using DISTVERSION because after the 9.9.9 release, it will release a "patchlevels" in the form of 9.9.9-P1. DISTVERSION would translate that into 9.9.9.p1, which, in the ports versioning scheme means 9.9.9 pre-release 1, which is before 9.9.9 and not after. So PORTVERSION is manually derived from an ISCVERSION variable to output 9.9.9p1.

The order into which the ports framework, and pkg, will sort versions is checked using the -t argument of pkg-version(8):

```
% pkg version -t 9.9.9 9.9.9.p1
> ①
% pkg version -t 9.9.9 9.9.9p1
< ②
```

① The > sign means that the first argument passed to -t is greater than the second argument. 9.9.9 is after 9.9.9.p1.

② The < sign means that the first argument passed to -t is less than the second argument. 9.9.9 is before 9.9.9p1.

In the port Makefile, for example dns/bind99, it is achieved by:

```
PORTNAME=  bind
PORTVERSION=  ${ISCVERSION:S/-P/P/:S/b/.b/:S/a/.a/:S/rc/.rc/}
CATEGORIES=  dns net
MASTER_SITES=  ISC/bind9/${ISCVERSION}
PKGNAMESUFFIX=  99
DISTNAME=  ${PORTNAME}-${ISCVERSION}
MAINTAINER=  mat@FreeBSD.org
COMMENT=  BIND DNS suite with updated DNSSEC and DNS64
LICENSE=  ISCL

# ISC releases things like 9.8.0-P1 or 9.8.1rc1, which our versioning does not like
ISCVERSION=  9.9.9-P6
```

Define upstream version in ISCVERSION, with a comment saying why it is needed. Use ISCVERSION to get a ports-compatible PORTVERSION. Use ISCVERSION directly to get the correct URL for fetching the distribution file. Use ISCVERSION directly to name the distribution file.
10. Derive DISTNAME from PORTVERSION

From time to time, the distribution file name has little or no relation to the version of the software.

In *comms/kermit*, only the last element of the version is present in the distribution file:

```
PORTNAME= kermit
PORTVERSION= 9.0.304
CATEGORIES= comms ftp net
DISTNAME= cku${PORTVERSION:E}-dev20
```

The :E *make*(1) modifier returns the suffix of the variable, in this case, 304. The distribution file is correctly generated as *cku304-dev20.tar.gz*.

11. Exotic Case 1

Sometimes, there is no relation between the software name, its version, and the distribution file it is distributed in.

From *audio/libworkman*:

```
PORTNAME= libworkman
PORTVERSION= 1.4
CATEGORIES= audio
MASTER_SITES= LOCAL/jim
DISTNAME= ${PORTNAME}-1999-06-20
```

12. Exotic Case 2

In *comms/libs232*, the distribution file is not versioned, so using DIST_SUBDIR is needed:

```
PORTNAME= libs232
PORTVERSION= 20160710
CATEGORIES= comms
MASTER_SITES= http://www.teuniz.net/RS-232/
DISTNAME= RS-232
DIST_SUBDIR= ${PORTNAME}-${PORTVERSION}
```
PKGNAMESUFFIX do not affect DISTNAME. Also note that if WRKDIR is equal to ${WRKDIR}/${DISTNAME} while the original source archive is named something other than ${PORTNAME}-${PORTVERSION}${EXTRACT_SUFX}, leave DISTNAME alone- defining only DISTFILES is easier than both DISTNAME and WRKDIR (and possibly EXTRACT_SUFX).

5.4.2. **MASTER_SITES**

Record the directory part of the FTP/HTTP-URL pointing at the original tarball in MASTER_SITES. Do not forget the trailing slash (/)!

The make macros will try to use this specification for grabbing the distribution file with FETCH if they cannot find it already on the system.

It is recommended that multiple sites are included on this list, preferably from different continents. This will safeguard against wide-area network problems.

MASTER_SITES must not be blank. It must point to the actual site hosting the distribution files. It cannot point to web archives, or the FreeBSD distribution files cache sites. The only exception to this rule is ports that do not have any distribution files. For example, meta-ports do not have any distribution files, so MASTER_SITES does not need to be set.

5.4.2.1. Using **MASTER_SITE_** Variables

Shortcut abbreviations are available for popular archives like SourceForge (SOURCEFORGE), GNU (GNU), or Perl CPAN (PERL_CPAN). MASTER_SITES can use them directly:

```
MASTER_SITES= GNU/make
```

The older expanded format still works, but all ports have been converted to the compact format. The expanded format looks like this:

```
MASTER_SITES= ${MASTER_SITE_GNU}
MASTER_SITE_SUBDIR= make
```

These values and variables are defined in Mk/bsd.sites.mk. New entries are added often, so make sure to check the latest version of this file before submitting a port.
For any `MASTER_SITE_FOO` variable, the shorthand `FOO` can be used. For example, use:

```
MASTER_SITES= FOO
```

If `MASTER_SITE_SUBDIR` is needed, use this:

```
MASTER_SITES= FOO/bar
```

Some `MASTER_SITE_*` names are quite long, and for ease of use, shortcuts have been defined:

<table>
<thead>
<tr>
<th>Macro</th>
<th>Shortcut</th>
</tr>
</thead>
<tbody>
<tr>
<td>PERL_CPAN</td>
<td>CPAN</td>
</tr>
<tr>
<td>GITHUB</td>
<td>GH</td>
</tr>
<tr>
<td>GITHUB_CLOUD</td>
<td>GHC</td>
</tr>
<tr>
<td>LIBREOFFICE_DEV</td>
<td>LODEV</td>
</tr>
<tr>
<td>NETLIB</td>
<td>NL</td>
</tr>
<tr>
<td>RUBYGEMS</td>
<td>RG</td>
</tr>
<tr>
<td>SOURCEFORGE</td>
<td>SF</td>
</tr>
</tbody>
</table>

### 5.4.2.2. Magic MASTER_SITES Macros

Several "magic" macros exist for popular sites with a predictable directory structure. For these, just use the abbreviation and the system will choose a subdirectory automatically. For a port named `Stardict`, of version `1.2.3`, and hosted on SourceForge, adding this line:

```
MASTER_SITES= SF
```

infers a subdirectory named `/project/stardict/stardict/1.2.3`. If the inferred directory is incorrect, it can be overridden:

```
MASTER_SITES= SF/stardict/WyabdcRealPeopleTTS/${PORTVERSION}
```

This can also be written as

```
MASTER_SITES= SF
MASTER_SITE_SUBDIR= stardict/WyabdcRealPeopleTTS/${PORTVERSION}
```

### 表 3. Shortcuts for MASTER_SITE_* Macros

<td>${PORTNAME:tl}/${PORTNAME:tl}/${PORTVERSION}</td>
</tr>
</tbody>
</table>

### 5.4.3. USE_GITHUB

If the distribution file comes from a specific commit or tag on GitHub for which there is no officially released file, there is an easy way to set the right `DISTNAME` and `MASTER_SITES` automatically. These variables are available:

表 5. USE_GITHUB Description
<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>GH_ACCOUNT</td>
<td>Account name of the GitHub user hosting the project</td>
<td>${PORTNAME}</td>
</tr>
<tr>
<td>GH_PROJECT</td>
<td>Name of the project on GitHub</td>
<td>${PORTNAME}</td>
</tr>
<tr>
<td>GH_TAGNAME</td>
<td>Name of the tag to download (2.0.1, hash, ...) Using the name of a branch here is incorrect. It is also possible to use the hash of a commit id to do a snapshot.</td>
<td>${DISTVERSIONPREFIX}${DISTVERSION}${DISTVERSIONSUFFIX}</td>
</tr>
<tr>
<td>GH_SUBDIR</td>
<td>When the software needs an additional distribution file to be extracted within ${WRKSRC}, this variable can be used. See the examples in Fetching Multiple Files from GitHub for more information.</td>
<td>(none)</td>
</tr>
</tbody>
</table>

⚠️ Do not use GH_TUPLE for the default distribution file, as it has no default.

**例 13. Simple Use of USE_GITHUB**

While trying to make a port for version 1.2.7 of pkg from the FreeBSD user on github, at https://github.com/freebsd/pkg, The Makefile would end up looking like this (slightly stripped for the example):

```make
PORTNAME=   pkg
DISTVERSION=    1.2.7
USE_GITHUB= yes
GH_ACCOUNT= freebsd
```

It will automatically have MASTER_SITES set to GH and WRKSRC to ${WRKDIR}/pkg-1.2.7.
14. More Complete Use of USE_GITHUB

While trying to make a port for the bleeding edge version of pkg from the FreeBSD user on github, at https://github.com/freebsd/pkg, the Makefile ends up looking like this (slightly stripped for the example):

```makefile
PORTNAME= pkg-devel
DISTVERSION= 1.3.0.a.20140411

USE_GITHUB= yes
GH_ACCOUNT= freebsd
GH_PROJECT= pkg
GH_TAGNAME= 6dbb17b
```

It will automatically have MASTER_SITES set to GH and WRKSRC to ${WRKDIR}/pkg-6dbb17b.

20140411 is the date of the commit referenced in GH_TAGNAME, not the date the Makefile is edited, or the date the commit is made.

15. Use of USE_GITHUB with DISTVERSIONPREFIX

From time to time, GH_TAGNAME is a slight variation from DISTVERSION. For example, if the version is 1.0.2, the tag is v1.0.2. In those cases, it is possible to use DISTVERSIONPREFIX or DISTVERSIONSUFFIX:

```makefile
PORTNAME= foo
DISTVERSIONPREFIX= v
DISTVERSION= 1.0.2

USE_GITHUB= yes
```

It will automatically set GH_TAGNAME to v1.0.2, while WRKSRC will be kept to ${WRKDIR}/foo-1.0.2.
If there never was a version upstream, do not invent one like 0.1 or 1.0. Create the port with a DISTVERSION of gYYYYMMDD, where g is for Git, and YYYYMMDD represents the date the commit referenced in GH_TAGNAME.

```
PORTNAME=   bar
DISTVERSION=  g20140411

USE_GITHUB= yes
GH_TAGNAME= c472d66b
```

This creates a versioning scheme that increases over time, and that is still before version 0 (see Using pkg-version(8) to Compare Versions for details on pkg-version(8)):

```
% pkg version -t g20140411 0 <
```

Which means using PORTEPOCH will not be needed in case upstream decides to cut versions in the future.
If the current version of the software uses a Git tag, and the port needs to be updated to a newer, intermediate version, without a tag, use `git-describe(1)` to find out the version to use:

```
% git describe --tags f0038b1
v0.7.3-14-gf0038b1
```

`v0.7.3-14-gf0038b1` can be split into three parts:

- **v0.7.3**
  - This is the last Git tag that appears in the commit history before the requested commit.

- **-14**
  - This means that the requested commit, `f0038b1`, is the 14th commit after the `v0.7.3` tag.

- **-gf0038b1**
  - The `-g` means "Git", and the `f0038b1` is the commit hash that this reference points to.

```
PORTNAME=   bar
DISTVERSIONPREFIX=  v
DISTVERSION=    0.7.3-14
DISTVERSIONSUFFIX=  -gf0038b1
USE_GITHUB= yes
```

This creates a versioning scheme that increases over time (well, over commits), and does not conflict with the creation of a `0.7.4` version. (See Using `pkg-version(8)` to Compare Versions for details on `pkg-version(8)`):

```
% pkg version -t 0.7.3 0.7.3.14
<
% pkg version -t 0.7.3.14 0.7.4
<
```

If the requested commit is the same as a tag, a shorter description is shown by default. The longer version is equivalent:

```
% git describe --tags c66c71d
v0.7.3

% git describe --tags --long c66c71d
v0.7.3-0-gc66c71d
```
5.4.3.1. Fetching Multiple Files from GitHub

The `USE_GITHUB` framework also supports fetching multiple distribution files from different places in GitHub. It works in a way very similar to Multiple Distribution or Patches Files from Multiple Locations.

Multiple values are added to `GH_ACCOUNT`, `GH_PROJECT`, and `GH_TAGNAME`. Each different value is assigned a group. The main value can either have no group, or the `:DEFAULT` group. A value can be omitted if it is the same as the default as listed in `USE_GITHUB Description`.

`GH_TUPLE` can also be used when there are a lot of distribution files. It helps keep the account, project, tagname, and group information at the same place.

For each group, a `${WRKSRC_group}` helper variable is created, containing the directory into which the file has been extracted. The `${WRKSRC_group}` variables can be used to move directories around during post-extract, or add to `CONFIGURE_ARGS`, or whatever is needed so that the software builds correctly.

- The `:group` part must be used for only one distribution file. It is used as a unique key and using it more than once will overwrite the previous values.

- As this is only syntactic sugar above `DISTFILES` and `MASTER_SITES`, the group names must adhere to the restrictions on group names outlined in Multiple Distribution or Patches Files from Multiple Locations

When fetching multiple files from GitHub, sometimes the default distribution file is not fetched from GitHub. To disable fetching the default distribution, set:

```
USE_GITHUB= nodefault
```

When using `USE_GITHUB=nodefault`, the Makefile must set `DISTFILES` in its top block. The definition should be:

```
DISTFILES=    ${DISTNAME}${EXTRACT_SUFX}
```
From time to time, there is a need to fetch more than one distribution file. For example, when the upstream git repository uses submodules. This can be done easily using groups in the \texttt{GH\_*} variables:

\begin{verbatim}
PORTNAME= foo
DISTVERSION= 1.0.2

USE_GITHUB= yes
GH_ACCOUNT= bar:icons,contrib
GH_PROJECT= foo-icons:icons foo-contrib:contrib
GH_TAGNAME= 1.0:icons fa579bc:contrib
GH_SUBDIR= ext/icons:icons

CONFIGURE_ARGS= --with-contrib=${WRKSRC_contrib}
\end{verbatim}

This will fetch three distribution files from github. The default one comes from foo/foo and is version \texttt{1.0.2}. The second one, with the \texttt{icons} group, comes from bar/foo-icons and is in version \texttt{1.0}. The third one comes from bar/foo-contrib and uses the Git commit \texttt{fa579bc}. The distribution files are named \texttt{foo-foo-1.0.2\_GH0.tar.gz}, \texttt{bar-foo-icons-1.0\_GH0.tar.gz}, and \texttt{bar-foo-contrib-fa579bc\_GH0.tar.gz}.

All the distribution files are extracted in \texttt{${WRKDIR}} in their respective subdirectories. The default file is still extracted in \texttt{${WRKSRC}}, in this case, \texttt{${WRKDIR}/foo-1.0.2}. Each additional distribution file is extracted in \texttt{${WRKSRC\_group}}. Here, for the \texttt{icons} group, it is called \texttt{${WRKSRC\_icons}} and it contains \texttt{${WRKDIR}/foo-icons-1.0}. The file with the \texttt{contrib} group is called \texttt{${WRKSRC\_contrib}} and contains \texttt{${WRKDIR}/foo-contrib-fa579bc}.

The software's build system expects to find the icons in a ext/icons subdirectory in its sources, so \texttt{GH\_SUBDIR} is used. \texttt{GH\_SUBDIR} makes sure that ext exists, but that ext/icons does not already exist. Then it does this:

\begin{verbatim}
post-extract:
  @${MV} ${WRKSRC\_icons} ${WRKSRC}/ext/icons
\end{verbatim}
This is functionally equivalent to Use of USE_GITHUB with Multiple Distribution Files, but using GH_TUPLE:

```bash
PORTNAME=   foo
DISTVERSION=    1.0.2

USE_GITHUB= yes
GH_TUPLE=   bar:foo-icons:1.0:icons/ext/icons \ 
            bar:foo-contrib:fa579bc:contrib

CONFIGURE_ARGS= --with-contrib=${WRKSRC_contrib}
```

Grouping was used in the previous example with bar:icons,contrib. Some redundant information is present with GH_TUPLE because grouping is not possible.
Ports with GitHub as an upstream repository sometimes use submodules. See `git-submodule(1)` for more information.

The problem with submodules is that each is a separate repository. As such, they each must be fetched separately.

Using `finance/moneymanagerex` as an example, its GitHub repository is `https://github.com/moneymanagerex/moneymanagerex`. It has a `.gitmodules` file at the root. This file describes all the submodules used in this repository, and lists additional repositories needed. This file will tell what additional repositories are needed:

```plaintext
[submodule "lib/wxsqlite3"]
  path = lib/wxsqlite3
  url = https://github.com/utelle/wxsqlite3.git
[submodule "3rd/mongoose"]
  path = 3rd/mongoose
  url = https://github.com/cesanta/mongoose.git
[submodule "3rd/LuaGlue"]
  path = 3rd/LuaGlue
  url = https://github.com/moneymanagerex/LuaGlue.git
[submodule "3rd/cgitemplate"]
  path = 3rd/cgitemplate
  url = https://github.com/moneymanagerex/html-template.git
[...]
```

The only information missing from that file is the commit hash or tag to use as a version. This information is found after cloning the repository:
% git clone --recurse-submodules
https://github.com/moneymanagerex/moneymanagerex.git
Cloning into 'moneymanagerex'...

Submodule path '3rd/mongoose': checked out '2140e5992ab9a3a9a34ce9a281abf57f00f95cda'
Submodule path 'lib/wxsqlite3': checked out 'fb66eb230d8aed21dec273b38c7c054dcb7d6b51'
[...]
% cd moneymanagerex
% git submodule status
  c51d11a247ee4d1e9817dfa2a8da8d9e2f97ae3b 3rd/LuaGlue (heads/master)
cd434eeeb35904ebcd3d718ba29c281a649b192c 3rd/cgitemplate (cd434ee)
2140e5992ab9a3a9a34ce9a281abf57f00f95cda 3rd/mongoose (6.2-138-g2140e59)
fb66eb230d8aed21dec273b38c7c054dcb7d6b51 lib/wxsqlite3 (v3.4.0)
[...]

It can also be found on GitHub. Each subdirectory that is a submodule is shown as directory @ hash, for example, mongoose @ 2140e59.
While getting the information from GitHub seems more straightforward, the information found using `git submodule status` will provide more meaningful information. For example, here, `lib/wxsqlite3`'s commit hash `fb66eb2` correspond to `v3.4.0`. Both can be used interchangeably, but when a tag is available, use it.

Now that all the required information has been gathered, the Makefile can be written (only GitHub-related lines are shown):

```
PORTNAME=    moneymanagerex
DISTVERSIONPREFIX=  v
DISTVERSION=    1.3.0

USE_GITHUB= yes
GH_TUPLE=   utelle:wxsqlite3:v3.4.0:wxsqlite3/lib/wxsqlite3 \
            moneymanagerex:LuaGlue:c51d11a:lua_glue/3rd/LuaGlue \
            moneymanagerex:html-template:cd434ee:html_template/3rd/cgitemplate \
            cesanta:mongoose:2140e59:mongoose/3rd/mongoose \
            [...]
```

### 5.4.4. USE_GITLAB

Similar to GitHub, if the distribution file comes from gitlab.com or is hosting the GitLab software, these variables are available for use and might need to be set.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>GL_SITE</td>
<td>Site name hosting the GitLab project</td>
<td><a href="https://gitlab.com">https://gitlab.com</a></td>
</tr>
<tr>
<td>GL_ACCOUNT</td>
<td>Account name of the GitLab user hosting the project</td>
<td>${PORTNAME}</td>
</tr>
<tr>
<td>GL_PROJECT</td>
<td>Name of the project on GitLab</td>
<td>${PORTNAME}</td>
</tr>
<tr>
<td>GL_COMMIT</td>
<td>The commit hash to download. Must be the full 160 bit, 40 character hex sha1 hash. This is a required variable for GitLab.</td>
<td>(none)</td>
</tr>
<tr>
<td>GL_SUBDIR</td>
<td>When the software needs an additional distribution file to be extracted within <code>$(WRKSRC)</code>, this variable can be used. See the examples in Fetching Multiple Files from GitLab for more information.</td>
<td>(none)</td>
</tr>
</tbody>
</table>
While trying to make a port for version 1.14 of libsignon-glib from the accounts-sso user on gitlab.com, at https://gitlab.com/accounts-sso/libsignon-glib, The Makefile would end up looking like this for fetching the distribution files:

```
PORTNAME=   libsignon-glib
DISTVERSION=    1.14
USE_GITLAB= yes
GL_ACCOUNT= accounts-sso
GL_COMMIT= e90302e342bdf27bc8c9132ab9d0ea3d8723fd03
```

It will automatically have MASTER_SITES set to gitlab.com and WRKSRC to ${WRKDIR}/libsignon-glib-e90302e342bdf27bc8c9132ab9d0ea3d8723fd03-e90302e342bdf27bc8c9132ab9d0ea3d8723fd03.

A more complete use of the above if port had no versioning and foobar from the foo user on project bar on a self hosted GitLab site https://gitlab.example.com, the Makefile ends up looking like this for fetching distribution files:

```
PORTNAME=   foobar
DISTVERSION=    g20170906
USE_GITLAB= yes
GL_SITE=    https://gitlab.example.com
GL_ACCOUNT= foo
GL_PROJECT= bar
GL_COMMIT= 9c1669ce60c3f4f5eb43df874d7314483fb3f8a6
```

It will have MASTER_SITES set to "https://gitlab.example.com" and WRKSRC to ${WRKDIR}/bar-9c1669ce60c3f4f5eb43df874d7314483fb3f8a6-9c1669ce60c3f4f5eb43df874d7314483fb3f8a6.

20170906 is the date of the commit referenced in GL_COMMIT, not the date the Makefile is edited, or the date the commit to the FreeBSD ports tree is made.

GL_SITE’s protocol, port and webroot can all be modified in the same variable.

5.4.4.1. Fetching Multiple Files from GitLab

The USE_GITLAB framework also supports fetching multiple distribution files from different places from GitLab and GitLab hosted sites. It works in a way very similar to Multiple Distribution or Patches Files from Multiple Locations and Fetching Multiple Files from GitLab.
Multiple values are added to `GL_SITE`, `GL_ACCOUNT`, `GL_PROJECT` and `GL_COMMIT`. Each different value is assigned a group. **USE_GITLAB Description.**

**GL_TUPLE** can also be used when there are a lot of distribution files. It helps keep the site, account, project, commit, and group information at the same place.

For each group, a `${WRKSRC_group}` helper variable is created, containing the directory into which the file has been extracted. The `${WRKSRC_group}` variables can be used to move directories around during *post-extract*, or add to `CONFIGURE_ARGS`, or whatever is needed so that the software builds correctly.

- The ':group part *must* be used for *only one* distribution file. It is used as a unique key and using it more than once will overwrite the previous values.
- As this is only syntactic sugar above `DISTFILES` and `MASTER_SITES`, the group names must adhere to the restrictions on group names outlined in [Multiple Distribution or Patches Files from Multiple Locations](#).

When fetching multiple files using GitLab, sometimes the default distribution file is not fetched from a GitLab site. To disable fetching the default distribution, set:

```
USE_GITLAB= nodefault
```

When using `USE_GITLAB=nodefault`, the Makefile must set `DISTFILES` in its *top block*. The definition should be:

```
DISTFILES=    ${DISTNAME}${EXTRACT_SUFX}
```
From time to time, there is a need to fetch more than one distribution file. For example, when the upstream git repository uses submodules. This can be done easily using groups in the GL_* variables:

```bash
PORTNAME=   foo
DISTVERSION=    1.0.2
USE_GITLAB= yes
GL_SITE=    https://gitlab.example.com:9434/gitlab:icons
GL_ACCOUNT= bar:icons,contrib
GL_PROJECT= foo-icons:icons foo-contrib:contrib
GL_COMMIT=  c189207a55da45305c884fe2b50e086fcad4724b
ae7368cab1ca7ca754b38d49da064df87968ffe4:icons
9e4dd76ad9b38f33fd417a4c01935958d5acd2a:contrib
GL_SUBDIR=  ext/icons:icons

CONFIGURE_ARGS= --with-contrib=${WRKSRC_contrib}
```

This will fetch two distribution files from gitlab.com and one from gitlab.example.com hosting GitLab. The default one comes from https://gitlab.com/foo/foo and commit is c189207a55da45305c884fe2b50e086fcad4724b. The second one, with the icons group, comes from https://gitlab.example.com:9434/gitlab/bar/foo-icons and commit is ae7368cab1ca7ca754b38d49da064df87968ffe4. The third one comes from https://gitlab.com/bar/foo-contrib and is commit 9e4dd76ad9b38f33fd417a4c01935958d5acd2a. The distribution files are named foo-foo-c189207a55da45305c884fe2b50e086fcad4724b_GL0.tar.gz, bar-foo-icons-ae7368cab1ca7ca754b38d49da064df87968ffe4_GL0.tar.gz, and bar-foo-contrib-9e4dd76ad9b38f33fd417a4c01935958d5acd2a_GL0.tar.gz.

All the distribution files are extracted in ${WRKDIR} in their respective subdirectories. The default file is still extracted in ${WRKSRC}, in this case, ${WRKDIR}/foo-c189207a55da45305c884fe2b50e086fcad4724b-c189207a55da45305c884fe2b50e086fcad4724b. Each additional distribution file is extracted in ${WRKSRC_group}. Here, for the icons group, it is called ${WRKDIR}/foo-icons-ae7368cab1ca7ca754b38d49da064df87968ffe4-ae7368cab1ca7ca754b38d49da064df87968ffe4. The file with the contrib group is called ${WRKDIR}/foo-contrib-9e4dd76ad9b38f33fd417a4c01935958d5acd2a-9e4dd76ad9b38f33fd417a4c01935958d5acd2a.

The software's build system expects to find the icons in a ext/icons subdirectory in its sources, so GL_SUBDIR is used. GL_SUBDIR makes sure that ext exists, but that ext/icons does not already exist. Then it does this:

```bash
post-extract:
  @${MV} ${WRKSRC_icons} ${WRKDIR}/ext/icons
```
This is functionally equivalent to Use of USE_GITLAB with Multiple Distribution Files, but using GL_TUPLE:

```
PORTNAME=   foo
DISTVERSION=   1.0.2
USE_GITLAB= yes
GL_COMMIT= c189207a55da45305c884fe2b50e086fcad4724b
GL_TUPLE= https://gitlab.example.com:9434/gitlab:foo-icons:ae7368cab1ca7ca754b38d49da064df87968ffe4:icons/ext/icons \  
bar:foo-contrib:9e4dd76ad9b38f33f0db417a4c01935958d5acd2a:contrib

CONFIGURE_ARGS= --with-contrib=${WRKSRC_contrib}
```

Grouping was used in the previous example with bar:icons,contrib. Some redundant information is present with GL_TUPLE because grouping is not possible.

5.4.5. EXTRACT_SUFX

If there is one distribution file, and it uses an odd suffix to indicate the compression mechanism, set EXTRACT_SUFX.

For example, if the distribution file was named foo.tar.gzip instead of the more normal foo.tar.gz, write:

```
DISTNAME=   foo
EXTRACT_SUFX= .tar.gzip
```

The USES=tar[:xxx], USES=lha or USES=zip automatically set EXTRACT_SUFX to the most common archives extensions as necessary, see Using USES Macros for more details. If neither of these are set then EXTRACT_SUFX defaults to .tar.gz.

As EXTRACT_SUFX is only used in DISTFILES, only set one of them.

5.4.6. DISTFILES

Sometimes the names of the files to be downloaded have no resemblance to the name of the port. For example, it might be called source.tar.gz or similar. In other cases the application’s source code might be in several different archives, all of which must be downloaded.

If this is the case, set DISTFILES to be a space separated list of all the files that must be downloaded.

```
DISTFILES= source1.tar.gz source2.tar.gz
```
If not explicitly set, `DISTFILES` defaults to `${DISTNAME}${EXTRACT_SUFX}.

### 5.4.7. **EXTRACTONLY**

If only some of the `DISTFILES` must be extracted—for example, one of them is the source code, while another is an uncompressed document—list the filenames that must be extracted in `EXTRACTONLY`.

```
DISTFILES= source.tar.gz manual.html
EXTRACTONLY= source.tar.gz
```

When none of the `DISTFILES` need to be uncompressed, set `EXTRACTONLY` to the empty string.

```
EXTRACTONLY=
```

### 5.4.8. **PATCHFILES**

If the port requires some additional patches that are available by FTP or HTTP, set `PATCHFILES` to the names of the files and `PATCH_SITES` to the URL of the directory that contains them (the format is the same as `MASTER_SITES`).

If the patch is not relative to the top of the source tree (that is, `WRKSRC`) because it contains some extra pathnames, set `PATCH_DIST_STRIP` accordingly. For instance, if all the pathnames in the patch have an extra `foozolix-1.0/` in front of the filenames, then set `PATCH_DIST_STRIP=-p1`.

Do not worry if the patches are compressed; they will be decompressed automatically if the filenames end with `.Z`, `.gz`, `.bz2` or `.xz`.

If the patch is distributed with some other files, such as documentation, in a compressed tarball, using `PATCHFILES` is not possible. If that is the case, add the name and the location of the patch tarball to `DISTFILES` and `MASTER_SITES`. Then, use `EXTRA_PATCHES` to point to those files and `bsd.port.mk` will automatically apply them. In particular, do not copy patch files into `${PATCHDIR}`. That directory may not be writable.

```
PATCHFILES= patch1 patch2:-p1
```

This does not conflict with the master site grouping feature, adding a group also works:

```
PATCHFILES= patch2:-p1:source2
```
The tarball will have been extracted alongside the regular source by then, so there is no need to explicitly extract it if it is a regular compressed tarball. Take extra care not to overwrite something that already exists in that directory if extracting it manually. Also, do not forget to add a command to remove the copied patch in the `pre-clean` target.

5.4.9. Multiple Distribution or Patches Files from Multiple Locations

(Consider this to be a somewhat "advanced topic"; those new to this document may wish to skip this section at first).

This section has information on the fetching mechanism known as both `MASTER_SITES:n` and `MASTER_SITES_NN`. We will refer to this mechanism as `MASTER_SITES:n`.

A little background first. OpenBSD has a neat feature inside `DISTFILES` and `PATCHFILES` which allows files and patches to be postfixed with `:n` identifiers. Here, `n` can be any word containing `[0-9a-zA-Z_]` and denote a group designation. For example:

```
DISTFILES= alpha:0 beta:1
```

In OpenBSD, distribution file `alpha` will be associated with variable `MASTER_SITES0` instead of our common `MASTER_SITES` and beta with `MASTER_SITES1`.

This is a very interesting feature which can decrease that endless search for the correct download site.

Just picture 2 files in `DISTFILES` and 20 sites in `MASTER_SITES`, the sites slow as hell where beta is carried by all sites in `MASTER_SITES`, and alpha can only be found in the 20th site. It would be such a waste to check all of them if the maintainer knew this beforehand, would it not? Not a good start for that lovely weekend!

Now that you have the idea, just imagine more `DISTFILES` and more `MASTER_SITES`. Surely our "distfiles survey meister" would appreciate the relief to network strain that this would bring.

In the next sections, information will follow on the FreeBSD implementation of this idea. We improved a bit on OpenBSD's concept.

The group names cannot have dashes in them (`-`), in fact, they cannot have any characters out of the `[a-zA-Z0-9_]` range. This is because, while `make(1)` is ok with variable names containing dashes, `sh(1)` is not.

5.4.9.1. Simplified Information

This section explains how to quickly prepare fine grained fetching of multiple distribution files and patches from different sites and subdirectories. We describe here a case of simplified `MASTER_SITES:n` usage. This will be sufficient for most scenarios. More detailed information are available in `Detailed Information`. 
Some applications consist of multiple distribution files that must be downloaded from a number of different sites. For example, Ghostscript consists of the core of the program, and then a large number of driver files that are used depending on the user’s printer. Some of these driver files are supplied with the core, but many others must be downloaded from a variety of different sites.

To support this, each entry in `DISTFILES` may be followed by a colon and a “group name”. Each site listed in `MASTER_SITES` is then followed by a colon, and the group that indicates which distribution files are downloaded from this site.

For example, consider an application with the source split in two parts, `source1.tar.gz` and `source2.tar.gz`, which must be downloaded from two different sites. The port’s Makefile would include lines like Simplified Use of `MASTER_SITES:n` with One File Per Site.

**Example 25. Simplified Use of `MASTER_SITES:n` with One File Per Site**

```plaintext
MASTER_SITES= ftp://ftp1.example.com/:source1  
                 http://www.example.com/:source2  
DISTFILES=  source1.tar.gz:source1  
            source2.tar.gz:source2
```

Multiple distribution files can have the same group. Continuing the previous example, suppose that there was a third distfile, `source3.tar.gz`, that is downloaded from `ftp.example2.com`. The Makefile would then be written like Simplified Use of `MASTER_SITES:n` with More Than One File Per Site.

**Example 26. Simplified Use of `MASTER_SITES:n` with More Than One File Per Site**

```plaintext
MASTER_SITES= ftp://ftp1.example.com/:source1  
                 http://www.example.com/:source2  
DISTFILES=  source1.tar.gz:source1  
            source2.tar.gz:source2  
            source3.tar.gz:source2
```

### 5.4.9.2. Detailed Information

Okay, so the previous example did not reflect the new port’s needs? In this section we will explain in detail how the fine grained fetching mechanism `MASTER_SITES:n` works and how it can be used.

1. Elements can be postfixed with `:`n where n is `[^;,:]+`, that is, n could conceptually be any alphanumeric string but we will limit it to `[a-zA-Z_][0-9a-zA-Z_]`+ for now.

   Moreover, string matching is case sensitive; that is, n is different from N.

   However, these words cannot be used for postfixing purposes since they yield special meaning: `default`, `all` and `ALL` (they are used internally in item ii). Furthermore, `DEFAULT` is a special purpose word (check item 3).
2. Elements postfixed with \( :n \) belong to the group \( n \), \( :m \) belong to group \( m \) and so forth.

3. Elements without a postfix are groupless, they all belong to the special group \texttt{DEFAULT}. Any elements postfixed with \texttt{DEFAULT}, is just being redundant unless an element belongs to both \texttt{DEFAULT} and other groups at the same time (check item 5).

These examples are equivalent but the first one is preferred:

```
MASTER_SITES=   alpha
MASTER_SITES=   alpha:DEFAULT
```

4. Groups are not exclusive, an element may belong to several different groups at the same time and a group can either have either several different elements or none at all.

5. When an element belongs to several groups at the same time, use the comma operator (,).

Instead of repeating it several times, each time with a different postfix, we can list several groups at once in a single postfix. For instance, \( :m,n,o \) marks an element that belongs to group \( m \), \( n \) and \( o \).

All these examples are equivalent but the last one is preferred:

```
MASTER_SITES=   alpha alpha:SOME_SITE
MASTER_SITES=   alpha:DEFAULT alpha:SOME_SITE
MASTER_SITES=   alpha:SOME_SITE,DEFAULT
MASTER_SITES=   alpha:DEFAULT,SOME_SITE
```

6. All sites within a given group are sorted according to \texttt{MASTER_SORT_AWK}. All groups within \texttt{MASTER_SITES} and \texttt{PATCH_SITES} are sorted as well.

7. Group semantics can be used in any of the variables \texttt{MASTER_SITES}, \texttt{PATCH_SITES}, \texttt{MASTER_SITE_SUBDIR}, \texttt{PATCH_SITE_SUBDIR}, \texttt{DISTFILES}, and \texttt{PATCHFILES} according to this syntax:

   a. All \texttt{MASTER_SITES}, \texttt{PATCH_SITES}, \texttt{MASTER_SITE_SUBDIR} and \texttt{PATCH_SITE_SUBDIR} elements must be terminated with the forward slash / character. If any elements belong to any groups, the group postfix \( :n \) must come right after the terminator /. The \texttt{MASTER_SITES:n} mechanism relies on the existence of the terminator / to avoid confusing elements where a \( :n \) is a valid part of the element with occurrences where \( :n \) denotes group \( n \). For compatibility purposes, since the / terminator was not required before in both \texttt{MASTER_SITE_SUBDIR} and \texttt{PATCH_SITE_SUBDIR} elements, if the postfix immediate preceding character is not a / then \( :n \) will be considered a valid part of the element instead of a group postfix even if an element is
postfixed with :n. See both Detailed Use of MASTER_SITES:n in MASTER_SITE_SUBDIR and Detailed Use of MASTER_SITES:n with Comma Operator, Multiple Files, Multiple Sites and Multiple Subdirectories.

例 27. Detailed Use of MASTER_SITES:n in MASTER_SITE_SUBDIR

```
MASTER_SITE_SUBDIR= old:n new/:NEW
```

- Directories within group DEFAULT → old:n
- Directories within group NEW → new
The previous example results in this fine grained fetching. Sites are listed in the exact order they will be used.

- file1 will be fetched from
  - MASTER_SITE_OVERRIDE
  - http://site1/directory-trial:1/
  - http://site1/directory-one/
  - http://site1/directory/
  - http://site2/
  - http://site7/
  - MASTER_SITE_BACKUP

- file2 will be fetched exactly as file1 since they both belong to the same group
  - MASTER_SITE_OVERRIDE
  - http://site1/directory-trial:1/
  - http://site1/directory-one/
  - http://site1/directory/
  - http://site2/
  - http://site7/
  - MASTER_SITE_BACKUP

- file3 will be fetched from
  - MASTER_SITE_OVERRIDE
  - http://site3/
  - MASTER_SITE_BACKUP

- file4 will be fetched from
8. How do I group one of the special macros from bsd.sites.mk, for example, SourceForge (SF)?

This has been simplified as much as possible. See Detailed Use of MASTER_SITES:n with SourceForge (SF).

例 29. Detailed Use of MASTER_SITES:n with SourceForge (SF)

```
MASTER_SITES= http://site1/ SF/something/1.0:sourceforge,TEST
DISTFILES= something.tar.gz:sourceforge
```

something.tar.gz will be fetched from all sites within SourceForge.

9. How do I use this with PATCH*?

All examples were done with MASTER* but they work exactly the same for PATCH* ones as can be seen in Simplified Use of MASTER_SITES:n with PATCH_SITES.

例 30. Simplified Use of MASTER_SITES:n with PATCH_SITES

```
PATCH_SITES= http://site1/ http://site2/:test
PATCHFILES= patch1:test
```
5.4.9.3. What Does Change for Ports? What Does Not?

i. All current ports remain the same. The `MASTER_SITES:n` feature code is only activated if there are elements postfixed with `:n` like elements according to the aforementioned syntax rules, especially as shown in item 7.

ii. The port targets remain the same: `checksum`, `makesum`, `patch`, `configure`, `build`, etc. With the obvious exceptions of `do-fetch`, `fetch-list`, `master-sites` and `patch-sites`.

- `do-fetch`: deploys the new grouping postfixed `DISTFILES` and `PATCHFILES` with their matching group elements within both `MASTER_SITES` and `PATCH_SITES` which use matching group elements within both `MASTER_SITE_SUBDIR` and `PATCH_SITE_SUBDIR`. Check Detailed Use of `MASTER_SITES:n` with Comma Operator, Multiple Files, Multiple Sites and Multiple Subdirectories.
- `fetch-list`: works like old `fetch-list` with the exception that it groups just like `do-fetch`.
- `master-sites` and `patch-sites`: (incompatible with older versions) only return the elements of group `DEFAULT`; in fact, they execute targets `master-sites-default` and `patch-sites-default` respectively.

Furthermore, using target either `master-sites-all` or `patch-sites-all` is preferred to directly checking either `MASTER_SITES` or `PATCH_SITES`. Also, directly checking is not guaranteed to work in any future versions. Check item B for more information on these new port targets.

iii. New port targets

a. There are `master-sites-n` and `patch-sites-n` targets which will list the elements of the respective group `n` within `MASTER_SITES` and `PATCH_SITES` respectively. For instance, both `master-sites-DEFAULT` and `patch-sites-DEFAULT` will return the elements of group `DEFAULT`, `master-sites-test` and `patch-sites-test` of group `test`, and thereon.

b. There are new targets `master-sites-all` and `patch-sites-all` which do the work of the old `master-sites` and `patch-sites` ones. They return the elements of all groups as if they all belonged to the same group with the caveat that it lists as many `MASTER_SITE_BACKUP` and `MASTER_SITE_OVERRIDE` as there are groups defined within either `DISTFILES` or `PATCHFILES`; respectively for `master-sites-all` and `patch-sites-all`.

5.4.10. DIST_SUBDIR

Do not let the port clutter `/usr/ports/distfiles`. If the port requires a lot of files to be fetched, or contains a file that has a name that might conflict with other ports (for example, Makefile), set `DIST_SUBDIR` to the name of the port (`${PORTNAME}` or `${PKGNAMEPREFIX}${PORTNAME}` are fine). This will change `DISTDIR` from the default `/usr/ports/distfiles` to `/usr/ports/distfiles/${DIST_SUBDIR}`, and in effect puts everything that is required for the port into that subdirectory.

It will also look at the subdirectory with the same name on the backup master site at `http://distcache.FreeBSD.org` (Setting `DISTDIR` explicitly in Makefile will not accomplish this, so please use `DIST_SUBDIR`.)

This does not affect `MASTER_SITES` defined in the Makefile.
5.5. MAINTAINER

Set your mail-address here. Please. :-)

Only a single address without the comment part is allowed as a MAINTAINER value. The format used is user@hostname.domain. Please do not include any descriptive text such as a real name in this entry. That merely confuses the Ports infrastructure and most tools using it.

The maintainer is responsible for keeping the port up to date and making sure that it works correctly. For a detailed description of the responsibilities of a port maintainer, refer to The challenge for port maintainers.

A maintainer volunteers to keep a port in good working order. Maintainers have the primary responsibility for their ports, but not exclusive ownership. Ports exist for the benefit of the community and, in reality, belong to the community. What this means is that people other than the maintainer can make changes to a port. Large changes to the Ports Collection might require changes to many ports. The FreeBSD Ports Management Team or members of other teams might modify ports to fix dependency issues or other problems, like a version bump for a shared library update.

Some types of fixes have "blanket approval" from the Ports Management Team <portmgr@FreeBSD.org>, allowing any committer to fix those categories of problems on any port. These fixes do not need approval from the maintainer.

Blanket approval for most ports applies to fixes like infrastructure changes, or trivial and tested build and runtime fixes. The current list is available in Ports section of the Committer’s Guide.

Other changes to the port will be sent to the maintainer for review and approval before being committed. If the maintainer does not respond to an update request after two weeks (excluding major public holidays), then that is considered a maintainer timeout, and the update can be made without explicit maintainer approval. If the maintainer does not respond within three months, or if there have been three consecutive timeouts, then that maintainer is considered absent without leave, and all of their ports can be assigned back to the pool. Exceptions to this are anything maintained by the Ports Management Team <portmgr@FreeBSD.org>, or the Security Officer Team <security-officer@FreeBSD.org>. No unauthorized commits may ever be made to ports maintained by those groups.

We reserve the right to modify the maintainer’s submission to better match existing policies and style of the Ports Collection without explicit blessing from the submitter or the maintainer. Also, large infrastructural changes can result in a port being modified without the maintainer’s consent. These kinds of changes will never affect the port’s functionality.

The Ports Management Team <portmgr@FreeBSD.org> reserves the right to revoke or override anyone’s maintainership for any reason, and the Security Officer Team <security-officer@FreeBSD.org> reserves the right to revoke or override maintainership for security reasons.
5.6. **COMMENT**

The comment is a one-line description of a port shown by `pkg info`. Please follow these rules when composing it:

1. The COMMENT string should be 70 characters or less.
2. Do *not* include the package name or version number of software.
3. The comment must begin with a capital and end without a period.
4. Do not start with an indefinite article (that is, A or An).
5. Capitalize names such as Apache, JavaScript, or Perl.
6. Use a serial comma for lists of words: "green, red, and blue."
7. Check for spelling errors.

Here is an example:

```
COMMENT= Cat chasing a mouse all over the screen
```

The COMMENT variable immediately follows the MAINTAINER variable in the Makefile.

5.7. **Licenses**

Each port must document the license under which it is available. If it is not an OSI approved license it must also document any restrictions on redistribution.

5.7.1. **LICENSE**

A short name for the license or licenses if more than one license apply.

If it is one of the licenses listed in Predefined License List, only `LICENSE_FILE` and `LICENSE_DISTFILES` variables can be set.

If this is a license that has not been defined in the ports framework (see Predefined License List), the `LICENSE_PERMS` and `LICENSE_NAME` must be set, along with either `LICENSE_FILE` or `LICENSE_TEXT`. `LICENSE_DISTFILES` and `LICENSE_GROUPS` can also be set, but are not required.

The predefined licenses are shown in Predefined License List. The current list is always available in Mk/bsd.licenses.db.mk.
31. Simplest Usage, Predefined Licenses

When the README of some software says "This software is under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version." but does not provide the license file, use this:

```
LICENSE= LGPL21+
```

When the software provides the license file, use this:

```
LICENSE= LGPL21+
LICENSE_FILE= ${WRKSRC}/COPYING
```

For the predefined licenses, the default permissions are `dist-mirror dist-sell pkg-mirror pkg-sell auto-accept`.

### 5.7.2. LICENSE_PERMS and LICENSE_PERMS_NAME_

Permissions. use none if empty.

**License Permissions List**

**dist-mirror**
Redistribution of the distribution files is permitted. The distribution files will be added to the FreeBSD MASTER_SITE_BACKUP CDN.

**no-dist-mirror**
Redistribution of the distribution files is prohibited. This is equivalent to setting RESTRICTED. The distribution files will not be added to the FreeBSD MASTER_SITE_BACKUP CDN.

**dist-sell**
Selling of distribution files is permitted. The distribution files will be present on the installer images.

**no-dist-sell**
Selling of distribution files is prohibited. This is equivalent to setting NO_CDROM.

**pkg-mirror**
Free redistribution of package is permitted. The package will be distributed on the FreeBSD package CDN https://pkg.freebsd.org/.

**no-pkg-mirror**
Free redistribution of package is prohibited. Equivalent to setting NO_PACKAGE. The package will not be distributed from the FreeBSD package CDN https://pkg.freebsd.org/.

**pkg-sell**
Selling of package is permitted. The package will be present on the installer images.
no-pkg-sell

Selling of package is prohibited. This is equivalent to setting NO_CDROM. The package will not be present on the installer images.

auto-accept

License is accepted by default. Prompts to accept a license are not displayed unless the user has defined LICENSES_ASK. Use this unless the license states the user must accept the terms of the license.

no-auto-accept

License is not accepted by default. The user will always be asked to confirm the acceptance of this license. This must be used if the license states that the user must accept its terms.

When both permission and no-permission is present the no-permission will cancel permission.

When permission is not present, it is considered to be a no-permission.

Some missing permissions will prevent a port (and all ports depending on it) from being usable by package users:

A port without the auto-accept permission will never be built and all the ports depending on it will be ignored.

A port without the pkg-mirror permission will be removed, as well as all the ports depending on it, after the build and they will ever end up being distributed.

例 32. Nonstandard License

Read the terms of the license and translate those using the available permissions.

```
LICENSE=        UNKNOWN
LICENSE_NAME=   unknown
LICENSE_TEXT=   This program is NOT in public domain.\n                It can be freely distributed for non-commercial purposes only.
LICENSE_PERMS=  dist-mirror no-dist-sell pkg-mirror no-pkg-sell auto-accept
```
Read the terms of the license and express those using the available permissions. In case of doubt, please ask for guidance on the FreeBSD ports 郵論壇.

| LICENSE= | WARSOW GPLv2 |
| LICENSE_COMB= | multi |
| LICENSE_NAME_WARSOW= | Warsow Content License |
| LICENSE_FILE_WARSOW= | ${WRKSRCP}/docs/license.txt |
| LICENSE_PERMS_WARSOW= | dist-mirror pkg-mirror auto-accept |

When the permissions of the GPLv2 and the UNKNOWN licenses are mixed, the port ends up with dist-mirror dist-sell pkg-mirror pkg-sell auto-accept dist-mirror no-dist-sell pkg-mirror no-pkg-sell auto-accept. The no-permissions cancel the permissions. The resulting list of permissions are dist-mirror pkg-mirror auto-accept. The distribution files and the packages will not be available on the installer images.

5.7.3. LICENSE_GROUPS and LICENSE_GROUPS_NAME

Groups the license belongs.

Predefined License Groups List

FSF

Free Software Foundation Approved, see the FSF Licensing & Compliance Team.

GPL

GPL Compatible

OSI

OSI Approved, see the Open Source Initiative Open Source Licenses page.

COPYFREE

Comply with Copyfree Standard Definition, see the Copyfree Licenses page.

FONTS

Font licenses

5.7.4. LICENSE_NAME and LICENSE_NAME_NAME

Full name of the license.
5.7.5. **LICENSE_FILE and LICENSE_FILE_NAME**

Full path to the file containing the license text, usually %{WRKSRC}/some/file. If the file is not in the distfile, and its content is too long to be put in LICENSE_TEXT, put it in a new file in %{FILESDIR}.

### Example 35. LICENSE_FILE

```text
LICENSE= GPLv3+
LICENSE_FILE= %{WRKSRC}/COPYING
```

5.7.6. **LICENSE_TEXT and LICENSE_TEXT_NAME**

Text to use as a license. Useful when the license is not in the distribution files and its text is short.

### Example 36. LICENSE_TEXT

```text
LICENSE= UNKNOWN
LICENSE_NAME= unknown
LICENSE_TEXT= This program is NOT in public domain.\nIt can be freely distributed for non-commercial purposes only,\nand THERE IS NO WARRANTY FOR THIS PROGRAM.
LICENSE_PERMS= dist-mirror no-dist-sell pkg-mirror no-pkg-sell auto-accept
```

5.7.7. **LICENSE_DISTFILES and LICENSE_DISTFILES_NAME**

The distribution files to which the licenses apply. Defaults to all the distribution files.
37. LICENSE_DISTFILES

Used when the distribution files do not all have the same license. For example, one has a code license, and another has some artwork that cannot be redistributed:

```
MASTER_SITES= SF/some-game
DISTFILES= ${DISTNAME}${EXTRACT_SUFX} artwork.zip

LICENSE= BSD3CLAUSE ARTWORK
LICENSE_COMB= dual
LICENSE_NAME_ARTWORK= The game artwork license
LICENSE_TEXT_ARTWORK= The README says that the files cannot be redistributed
LICENSE_PERMS_ARTWORK= pkg-mirror pkg-sell auto-accept
LICENSE_DISTFILES_BSD3CLAUSE= ${DISTNAME}${EXTRACT_SUFX}
LICENSE_DISTFILES_ARTWORK= artwork.zip
```

5.7.8. LICENSE_COMB

Set to `multi` if all licenses apply. Set to `dual` if any license applies. Defaults to `single`.

38. Dual Licenses

When a port says "This software may be distributed under the GNU General Public License or the Artistic License", it means that either license can be used. Use this:

```
LICENSE= ART10 GPLv1
LICENSE_COMB= dual
```

If license files are provided, use this:

```
LICENSE= ART10 GPLv1
LICENSE_COMB= dual
LICENSE_FILE_ART10= ${WRKSRC}/Artistic
LICENSE_FILE_GPLv1= ${WRKSRC}/Copying
```

39. Multiple Licenses

When part of a port has one license, and another part has a different license, use `multi`:

```
LICENSE= GPLv2 LGPL21+
LICENSE_COMB= multi
```
Portscout is an automated distfile check utility for the FreeBSD Ports Collection, described in detail in Portscout: the FreeBSD Ports Distfile Scanner.

PORTSCOUT defines special conditions within which the Portscout distfile scanner is restricted.

Situations where PORTSCOUT is set include:

- When distfiles have to be ignored for specific versions. For example, to exclude version 8.2 and version 8.3 from distfile version checks because they are known to be broken, add:

  PORTSCOUT= skipv:8.2,8.3

- When distfile version checks have to be disabled completely. For example, if a port is not going to be updated ever again, add:

  PORTSCOUT= ignore:1

- When specific versions or specific major and minor revisions of a distfile must be checked. For example, if only version 0.6.4 must be monitored because newer versions have compatibility issues with FreeBSD, add:

  PORTSCOUT= limit:^0\.

- When URLs listing the available versions differ from the download URLs. For example, to limit distfile version checks to the download page for the databases/pgtune port, add:

  PORTSCOUT= site:http://pgfoundry.org/frs/?group_id=1000416

5.9. Dependencies

Many ports depend on other ports. This is a very convenient feature of most Unix-like operating systems, including FreeBSD. Multiple ports can share a common dependency, rather than bundling that dependency with every port or package that needs it. There are seven variables that can be used to ensure that all the required bits will be on the user’s machine. There are also some pre-supported dependency variables for common cases, plus a few more to control the behavior of dependencies.
When software has extra dependencies that provide extra features, the base dependencies listed in 
*DEPENDS* should include the extra dependencies that would benefit most users. The base dependencies should never be a "minimal" dependency set. The goal is not to include every dependency possible. Only include those that will benefit most people.

5.9.1. **LIB_DEPENDS**

This variable specifies the shared libraries this port depends on. It is a list of *lib:*dir* tuples where *lib* is the name of the shared library, *dir* is the directory in which to find it in case it is not available. For example,

```
LIB_DEPENDS=   libjpeg.so:graphics/jpeg
```

will check for a shared jpeg library with any version, and descend into the graphics/jpeg subdirectory of the ports tree to build and install it if it is not found.

The dependency is checked twice, once from within the *build* target and then from within the *install* target. Also, the name of the dependency is put into the package so that *pkg install* (see *pkg-install(8)*) will automatically install it if it is not on the user's system.

5.9.2. **RUN_DEPENDS**

This variable specifies executables or files this port depends on during run-time. It is a list of *path:*dir:*target* tuples where *path* is the name of the executable or file, *dir* is the directory in which to find it in case it is not available, and *target* is the target to call in that directory. If *path* starts with a slash (/), it is treated as a file and its existence is tested with *test -e*; otherwise, it is assumed to be an executable, and *which -s* is used to determine if the program exists in the search path.

For example,

```
RUN_DEPENDS=    ${LOCALBASE}/news/bin/innd:news/inn \
                xmlcatmgr:textproc/xmlcatmgr
```

will check if the file or directory /usr/local/news/bin/innd exists, and build and install it from the news/inn subdirectory of the ports tree if it is not found. It will also see if an executable called xmlcatmgr is in the search path, and descend into textproc/xmlcatmgr to build and install it if it is not found.

In this case, innd is actually an executable; if an executable is in a place that is not expected to be in the search path, use the full pathname.
The official search PATH used on the ports build cluster is

/sbin:/bin:/usr/sbin:/usr/bin:/usr/local/sbin:/usr/local/bin

The dependency is checked from within the install target. Also, the name of the dependency is put into the package so that pkg install (see pkg-install(8)) will automatically install it if it is not on the user's system. The target part can be omitted if it is the same as DEPENDS_TARGET.

A quite common situation is when RUN_DEPENDS is literally the same as BUILD_DEPENDS, especially if ported software is written in a scripted language or if it requires the same build and run-time environment. In this case, it is both tempting and intuitive to directly assign one to the other:

```
RUN_DEPENDS=    ${BUILD_DEPENDS}
```

However, such assignment can pollute run-time dependencies with entries not defined in the port's original BUILD_DEPENDS. This happens because of make(1)'s lazy evaluation of variable assignment. Consider a Makefile with USE_*, which are processed by ports/Mk/bsd.*.mk to augment initial build dependencies. For example, USES= gmake adds devel/gmake to BUILD_DEPENDS. To prevent such additional dependencies from polluting RUN_DEPENDS, create another variable with the current content of BUILD_DEPENDS and assign it to both BUILD_DEPENDS and RUN_DEPENDS:

```
MY_DEPENDS= some:devel/some \
onther:lang/other
BUILD_DEPENDS=  ${MY_DEPENDS}
RUN_DEPENDS=    ${MY_DEPENDS}
```

Do not use := to assign BUILD_DEPENDS to RUN_DEPENDS or vice-versa. All variables are expanded immediately, which is exactly the wrong thing to do and almost always a failure.

5.9.3. BUILD_DEPENDS

This variable specifies executables or files this port requires to build. Like RUN_DEPENDS, it is a list of path:dir[:target] tuples. For example,

```
BUILD_DEPENDS=  unzip:archivers/unzip
```

will check for an executable called unzip, and descend into the archivers/unzip subdirectory of the ports tree to build and install it if it is not found.

"build" here means everything from extraction to compilation. The dependency is checked from within the extract target. The target part can be omitted if it is the same as DEPENDS_TARGET.
5.9.4. **FETCH_DEPENDS**

This variable specifies executables or files this port requires to fetch. Like the previous two, it is a list of `path:dir[:target]` tuples. For example,

```
FETCH_DEPENDS= ncftp2:net/ncftp2
```

will check for an executable called `ncftp2`, and descend into the `net/ncftp2` subdirectory of the ports tree to build and install it if it is not found.

The dependency is checked from within the `fetch` target. The `target` part can be omitted if it is the same as `DEPENDS_TARGET`.

5.9.5. **EXTRACT_DEPENDS**

This variable specifies executables or files this port requires for extraction. Like the previous, it is a list of `path:dir[:target]` tuples. For example,

```
EXTRACT_DEPENDS= unzip:archivers/unzip
```

will check for an executable called `unzip`, and descend into the `archivers/unzip` subdirectory of the ports tree to build and install it if it is not found.

The dependency is checked from within the `extract` target. The `target` part can be omitted if it is the same as `DEPENDS_TARGET`.

Use this variable only if the extraction does not already work (the default assumes `tar`) and cannot be made to work using `USES=tar`, `USES=lha` or `USES=zip` described in Using `USES` Macros.

5.9.6. **PATCH_DEPENDS**

This variable specifies executables or files this port requires to patch. Like the previous, it is a list of `path:dir[:target]` tuples. For example,

```
PATCH_DEPENDS= ${NONEXISTENT}:java/jfc:extract
```

will descend into the `java/jfc` subdirectory of the ports tree to extract it.

The dependency is checked from within the `patch` target. The `target` part can be omitted if it is the same as `DEPENDS_TARGET`.

5.9.7. **USES**

Parameters can be added to define different features and dependencies used by the port. They are specified by adding this line to the Makefile:
USES= feature[:arguments]

For the complete list of values, please see Using USES Macros.

⚠️ USES cannot be assigned after inclusion of bsd.port.pre.mk.

5.9.8. USE_*

Several variables exist to define common dependencies shared by many ports. Their use is optional, but helps to reduce the verbosity of the port Makefiles. Each of them is styled as USE_. These variables may be used only in the port Makefiles and ports/Mk/bsd.*.mk. They are not meant for user-settable options - use PORT_OPTIONS for that purpose.

⚠️ It is always incorrect to set any USE_* in /etc/make.conf. For instance, setting

USE_GCC=X.Y

(where X.Y is version number) would add a dependency on gccXY for every port, including lang/gccXY itself!
Variable | Means
---|---
USE_GCC | The port requires GCC (gcc or g++) to build. Some ports need a specific, old GCC version, some require modern, recent versions. It is typically set to yes (means always use stable, modern GCC from ports per GCC_DEFAULT in Mk/bsd.default-versions.mk). This is also the default value. The exact version can also be specified, with a value such as 10. The minimal required version can be specified as 10+. GCC from the base system is used when it satisfies the requested version, otherwise an appropriate compiler is built from ports, and CC and CXX are adjusted accordingly. The :build argument following the version specifier adds only a build time dependency to the port.

For example:

```
USE_GCC=yes     # port requires a current version of GCC
USE_GCC=11+:build  # port requires GCC 11 or later at build time only
```

`USE_GCC=any` is deprecated and should not be used in new ports

Variables related to gmake and configure are described in Building Mechanisms, while autoconf, automake and libtool are described in Using GNU Autotools. Perl related variables are described in Using Perl. X11 variables are listed in Using X11. Using Gnome deals with GNOME and Using KDE with KDE related variables. Using Java documents Java variables, while Web Applications contains information on Apache, PHP and PEAR modules. Python is discussed in Using Python, while Ruby in Using Ruby. Using SDL provides variables used for SDL applications and finally, Using Xfce contains information on Xfce.

5.9.9. Minimal Version of a Dependency

A minimal version of a dependency can be specified in any *DEPENDS except LIB_DEPENDS using this syntax:

```
p5-Spiffy>=0.26:devel/p5-Spiffy
```
The first field contains a dependent package name, which must match the entry in the package database, a comparison sign, and a package version. The dependency is satisfied if p5-Spiffy-0.26 or newer is installed on the machine.

5.9.10. Notes on Dependencies

As mentioned above, the default target to call when a dependency is required is **DEPENDS_TARGET**. It defaults to **install**. This is a user variable; it is never defined in a port's Makefile. If the port needs a special way to handle a dependency, use the :target part of **_*DEPENDS*** instead of redefining **DEPENDS_TARGET**.

When running **make clean**, the port dependencies are automatically cleaned too. If this is not desirable, define **NOCLEANDEPENDS** in the environment. This may be particularly desirable if the port has something that takes a long time to rebuild in its dependency list, such as KDE, GNOME or Mozilla.

To depend on another port unconditionally, use the variable **${NONEXISTENT}** as the first field of **BUILD_DEPENDS** or **RUN_DEPENDS**. Use this only when the source of the other port is needed. Compilation time can be saved by specifying the target too. For instance

```
BUILD_DEPENDS=  ${NONEXISTENT}:graphics/jpeg:extract
```

will always descend to the jpeg port and extract it.

5.9.11. Circular Dependencies Are Fatal

⚠️ Do not introduce any circular dependencies into the ports tree!

The ports building technology does not tolerate circular dependencies. If one is introduced, someone, somewhere in the world, will have their FreeBSD installation broken almost immediately, with many others quickly to follow. These can really be hard to detect. If in doubt, before making that change, make sure to run: **cd /usr/ports; make index**. That process can be quite slow on older machines, but it may be able to save a large number of people, including yourself, a lot of grief in the process.

5.9.12. Problems Caused by Automatic Dependencies

Dependencies must be declared either explicitly or by using the **OPTIONS framework**. Using other methods like automatic detection complicates indexing, which causes problems for port and package management.
The problem with trying to automatically add dependencies is that files and settings outside an individual port can change at any time. For example: an index is built, then a batch of ports are installed. But one of the ports installs the tested file. The index is now incorrect, because an installed port unexpectedly has a new dependency. The index may still be wrong even after rebuilding if other ports also determine their need for dependencies based on the existence of other files.

Testing option variables is the correct method. It will not cause inconsistencies in the index of a batch of ports, provided the options were defined prior to the index build. Simple scripts can then be used to automate the building, installation, and updating of these ports and their packages.

5.10. Slave Ports and MASTERDIR

If the port needs to build slightly different versions of packages by having a variable (for instance, resolution, or paper size) take different values, create one subdirectory per package to make it easier for users to see what to do, but try to share as many files as possible between ports. Typically, by using variables cleverly, only a very short Makefile is needed in all but one of the directories. In the sole Makefile, use MASTERDIR to specify the directory where the rest of the files are. Also, use a variable as part of PKGAMESUFFIX so the packages will have different names.

This will be best demonstrated by an example. This is part of print/pkfonts300/Makefile;
print/pkfonts300 also has all the regular patches, package files, etc. Running make there, it will take the default value for the resolution (300) and build the port normally.

As for other resolutions, this is the entire print/pkfonts360/Makefile:

```
RESOLUTION= 360
MASTERDIR= ${.CURDIR}/../pkfonts300
.include    "${MASTERDIR}/Makefile"
```

(print/pkfonts118/Makefile, print/pkfonts600/Makefile, and all the other are similar). MASTERDIR definition tells bsd.port.mk that the regular set of subdirectories like FILES_DIR and SCRIPT_DIR are to be found under pkfonts300. The RESOLUTION=360 line will override the RESOLUTION=300 line in pkfonts300/Makefile and the port will be built with resolution set to 360.

### 5.11. Man Pages

If the port anchors its man tree somewhere other than PREFIX, use MANDIRS to specify those directories. Note that the files corresponding to manual pages must be placed in pkg-plist along with the rest of the files. The purpose of MANDIRS is to enable automatic compression of manual pages, therefore the file names are suffixed with .gz.

### 5.12. Info Files

If the package needs to install GNU info files, list them in INFO (without the trailing .info), one entry per document. These files are assumed to be installed to PREFIX/INFO_PATH. Change INFO_PATH if the package uses a different location. However, this is not recommended. These entries contain just the path relative to PREFIX/INFO_PATH. For example, lang/gcc34 installs info files to
5.13. Makefile Options

Many applications can be built with optional or differing configurations. Examples include choice of natural (human) language, GUI versus command-line, or type of database to support. Users may need a different configuration than the default, so the ports system provides hooks the port author can use to control which variant will be built. Supporting these options properly will make users happy, and effectively provide two or more ports for the price of one.

5.13.1. OPTIONS

5.13.1.1. Background

OPTIONS_\* give the user installing the port a dialog showing the available options, and then saves those options to \${PORT_DBDIR}/\${OPTIONS_NAME}/options. The next time the port is built, the options are reused. PORT_DBDIR defaults to /var/db/ports. OPTIONS_NAME is to the port origin with an underscore as the space separator, for example, for dns/bind99 it will be dns_bind99.

When the user runs make config (or runs make build for the first time), the framework checks for \${PORT_DBDIR}/\${OPTIONS_NAME}/options. If that file does not exist, the values of OPTIONS_\* are used, and a dialog box is displayed where the options can be enabled or disabled. Then options is saved and the configured variables are used when building the port.

If a new version of the port adds new OPTIONS, the dialog will be presented to the user with the saved values of old OPTIONS prefilled.

make showconfig shows the saved configuration. Use make rmconfig to remove the saved configuration.

5.13.1.2. Syntax

OPTIONS_DEFINE contains a list of OPTIONS to be used. These are independent of each other and are not grouped:

OPTIONS_DEFINE= OPT1 OPT2

Once defined, OPTIONS are described (optional, but strongly recommended):
ports/Mk/bsd.options.desc.mk has descriptions for many common OPTIONS. While often useful, override them if the description is insufficient for the port.

When describing options, view it from the perspective of the user: “What functionality does it change?” and “Why would I want to enable this?” Do not just repeat the name. For example, describing the NLS option as “include NLS support” does not help the user, who can already see the option name but may not know what it means. Describing it as “Native Language Support via gettext utilities” is much more helpful.

Option names are always in all uppercase. They cannot use mixed case or lowercase.

OPTIONS can be grouped as radio choices, where only one choice from each group is allowed:

```makefile
OPTIONS_SINGLE= SG1
OPTIONS_SINGLE_SG1= OPT3 OPT4
```

There **must** be one of each OPTIONS_SINGLE group selected at all times for the options to be valid. One option of each group **must** be added to OPTIONS_DEFAULT.

OPTIONS can also be grouped as “multiple-choice” lists, where at least one option must be enabled:

```makefile
OPTIONS_MULTI= MG1
OPTIONS_MULTI_MG1= OPT5 OPT6
```

OPTIONS can also be grouped as “multiple-choice” lists, where none or any option can be enabled:

```makefile
OPTIONS_GROUP= GG1
OPTIONS_GROUP_GG1= OPT9 OPT10
```
OPTIONS are unset by default, unless they are listed in OPTIONS_DEFAULT:

```plaintext
OPTIONS_DEFAULT= OPT1 OPT3 OPT6
```

OPTIONS definitions must appear before the inclusion of bsd.port.options.mk. PORT_OPTIONS values can only be tested after the inclusion of bsd.port.options.mk. Inclusion of bsd.port.pre.mk can be used instead, too, and is still widely used in ports written before the introduction of bsd.port.options.mk. But be aware that some variables will not work as expected after the inclusion of bsd.port.pre.mk, typically some USE_* flags.

**Example 42. Simple Use of OPTIONS**

```plaintext
OPTIONS_DEFINE= FOO BAR
OPTIONS_DEFAULT=FOO

FOO_DESC= Option foo support
BAR_DESC= Feature bar support

# Will add --with-foo / --without-foo
FOO_CONFIGURE_WITH= foo
BAR_RUN_DEPENDS= bar:bar/bar

.include <bsd.port.mk>
```

**Example 43. Check for Unset Port OPTIONS**

```plaintext
.if ! ${PORT_OPTIONS:MEXAMPLES}
CONFIGURE_ARGS+=--without-examples
.endif
```

The form shown above is discouraged. The preferred method is using a configure knob to really enable and disable the feature to match the option:

```plaintext
# Will add --with-examples / --without-examples
EXAMPLES_CONFIGURE_WITH= examples
```
5.13.1.3. Default Options

These options are always on by default.

- **DOCS** - build and install documentation.
- **NLS** - Native Language Support.
- **EXAMPLES** - build and install examples.
- **IPV6** - IPv6 protocol support.

There is no need to add these to `OPTIONS_DEFAULT`. To have them active, and show up in the options selection dialog, however, they must be added to `OPTIONS_DEFINE`. 

```bash
OPTIONS_DEFINE=  EXAMPLES
OPTIONS_DEFAULT=  PSQL LDAP SSL

OPTIONS_SINGLE=  BACKEND
OPTIONS_SINGLE_BACKEND=  MYSQL PSQL BDB

OPTIONS_MULTI=  AUTH
OPTIONS_MULTI_AUTH=  LDAP PAM SSL

EXAMPLES_DESC=  Install extra examples
MYSQL_DESC=  Use MySQL as backend
PSQL_DESC=  Use PostgreSQL as backend
BDB_DESC=  Use Berkeley DB as backend
LDAP_DESC=  Build with LDAP authentication support
PAM_DESC=  Build with PAM support
SSL_DESC=  Build with OpenSSL support

# Will add USE_PSQL=yes
PGSQL_USE=  pgsql=yes
# Will add --enable-postgres / --disable-postgres
PGSQL_CONFIGURE_ENABLE=  postgres

ICU_LIB_DEPENDS=  libicuuc.so:devel/icu

# Will add --with-examples / --without-examples
EXAMPLES_CONFIGURE_WITH=  examples

# Check other OPTIONS

.include <bsd.port.mk>
```
5.13.2. Feature Auto-Activation

When using a GNU configure script, keep an eye on which optional features are activated by auto-detection. Explicitly disable optional features that are not needed by adding `--without-xxx` or `--disable-xxx` in `CONFIGURE_ARGS`.

Example 45. Wrong Handling of an Option

```
if ${PORT_OPTIONS:MFOO}
LIB_DEPENDS+= libfoo.so:devel/foo
CONFIGURE_ARGS+= --enable-foo
endif
```

In the example above, imagine a library libfoo is installed on the system. The user does not want this application to use libfoo, so he toggled the option off in the `make config` dialog. But the application's configure script detects the library present in the system and includes its support in the resulting executable. Now when the user decides to remove libfoo from the system, the ports system does not protest (no dependency on libfoo was recorded) but the application breaks.

Example 46. Correct Handling of an Option

```
FOO_LIB_DEPENDS= libfoo.so:devel/foo
  # Will add --enable-foo / --disable-foo
FOO_CONFIGURE_ENABLE= foo
```

Under some circumstances, the shorthand conditional syntax can cause problems with complex constructs. The errors are usually Malformed conditional, an alternative syntax can be used.

```
.if !empty(VARIABLE:MVALUE)
```

as an alternative to

```
.if ${VARIABLE:MVALUE}
```

5.13.3. Options Helpers

There are some macros to help simplify conditional values which differ based on the options set. For easier access, a comprehensive list is provided:

**PLIST_SUB, SUB_LIST**

For automatic `%%OPT%%` and `%%NOOPT%%` generation, see `OPTIONS_SUB`. 
For more complex usage, see *Generic Variables Replacement*, `OPT_VARIABLE` and `OPT_VARIABLE_OFF`.

**CONFIGURE_ARGS**

For `--enable-x` and `--disable-x`, see `OPT_CONFIGURE_ENABLE`.

For `--with-x` and `--without-x`, see `OPT_CONFIGURE_WITH`.

For all other cases, see `OPT_CONFIGURE_ON` and `OPT_CONFIGURE_OFF`.

**CMAKE_ARGS**

For arguments that are booleans (on, off, true, false, 0, 1) see `OPT_CMAKE_BOOL` and `OPT_CMAKE_BOOL_OFF`.

For all other cases, see `OPT_CMAKE_ON` and `OPT_CMAKE_OFF`.

**MESON_ARGS**

For arguments that take true or false, see `OPT_MESON_TRUE` and `OPT_MESON_FALSE`.

For arguments that take yes or no, use `OPT_MESON_YES` and `OPT_MESON_NO`.

For arguments that take enabled or disabled, see `OPT_MESON_ENABLED` and `OPT_MESON_DISABLED`.

For all other cases, use `OPT_MESON_ON` and `OPT_MESON_OFF`.

**QMAKE_ARGS**

See `OPT_QMAKE_ON` and `OPT_QMAKE_OFF`.

**USE_***

See `OPT_USE` and `OPT_USE_OFF`.

**_DEPENDS**

See *Dependencies*, `OPT_DEPTYPE` and `OPT_DEPTYPE_OFF`.

**(Any variable)**

The most used variables have direct helpers, see *Generic Variables Replacement*, `OPT_VARIABLE` and `OPT_VARIABLE_OFF`.

For any variable without a specific helper, see `OPT_VARS` and `OPT_VARS_OFF`.

**Options dependencies**

When an option need another option to work, see `OPT_IMPLIES`.

**Options conflicts**

When an option cannot work if another is also enabled, see `OPT_PREVENTS` and `OPT_PREVENTS_MSG`.

**Build targets**

When an option need some extra processing, see *Additional Build Targets*, `target-OPT-on` and `target-OPT-off`. 
5.13.3.1. OPTIONS_SUB

If OPTIONS_SUB is set to yes then each of the options added to OPTIONS_DEFINE will be added to PLIST_SUB and SUB_LIST, for example:

```plaintext
OPTIONS_DEFINE= OPT1
OPTIONS_SUB= yes
```

is equivalent to:

```plaintext
OPTIONS_DEFINE= OPT1

.include <bsd.port.options.mk>

.if ${PORT_OPTIONS:MOPT1}
  PLIST_SUB+= OPT1="" NO_OPT1="@comment ">
  SUB_LIST+= OPT1="" NO_OPT1="@comment ">
.else
  PLIST_SUB+= @comment " NO_OPT1=""
  SUB_LIST+= @comment " NO_OPT1=""
.endif
```

The value of OPTIONS_SUB is ignored. Setting it to any value will add PLIST_SUB and SUB_LIST entries for all options.

5.13.3.2. OPT_USE and OPT_USE_OFF

When option OPT is selected, for each key=value pair in OPT_USE, value is appended to the corresponding USE_KEY. If value has spaces in it, replace them with commas and they will be changed back to spaces during processing. OPT_USE_OFF works the same way, but when OPT is not selected. For example:

```plaintext
OPTIONS_DEFINE= OPT1
OPT1_USE=  xorg
OPT1_USE=   mysql=yes xorg=x11,xextproto,xext,xrandr
OPT1_USE_OFF=   openssl=yes
```

is equivalent to:
OPTIONS_DEFINE= OPT1

.include <bsd.port.options.mk>

.if ${PORT_OPTIONS:MOPT1}
USE_MYSQL= yes
USES+= xorg
USE_XORG= x11 xextproto xext xrandr
.else
USE_OPENSSL= yes
.endif

5.13.3.3. CONFIGURE_ARGS Helpers

5.13.3.3.1. OPT_CONFIGURE_ENABLE

When option OPT is selected, for each entry in OPT_CONFIGURE_ENABLE then --enable-entry is appended to CONFIGURE_ARGS. When option OPT is not selected, --disable-entry is appended to CONFIGURE_ARGS. An optional argument can be specified with an = symbol. This argument is only appended to the --enable-entry configure option. For example:

OPTIONS_DEFINE= OPT1 OPT2
OPT1_CONFIGURE_ENABLE= test1 test2
OPT2_CONFIGURE_ENABLE= test2=exhaustive

is equivalent to:

OPTIONS_DEFINE= OPT1

.include <bsd.port.options.mk>

.if ${PORT_OPTIONS:MOPT1}
CONFIGURE_ARGS+= --enable-test1 --enable-test2
.else
CONFIGURE_ARGS+= --disable-test1 --disable-test2
.endif

.if ${PORT_OPTIONS:MOPT2}
CONFIGURE_ARGS+= --enable-test2=exhaustive
.else
CONFIGURE_ARGS+= --disable-test2
.endif

5.13.3.3.2. OPT_CONFIGURE_WITH

When option OPT is selected, for each entry in OPT_CONFIGURE_WITH then --with-entry is appended to CONFIGURE_ARGS. When option OPT is not selected, --without-entry is appended to CONFIGURE_ARGS.
An optional argument can be specified with an = symbol. This argument is only appended to the --with-entry configure option. For example:

```
OPTIONS_DEFINE= OPT1 OPT2
OPT1_CONFIGURE_WITH=    test1
OPT2_CONFIGURE_WITH=    test2=exhaustive
```

is equivalent to:

```
OPTIONS_DEFINE= OPT1 OPT2

.include <bsd.port.options.mk>

.if ${PORT_OPTIONS:MOPT1}
CONFIGURE_ARGS+=    --with-test1
.else
CONFIGURE_ARGS+=    --without-test1
.endif

.if ${PORT_OPTIONS:MOPT2}
CONFIGURE_ARGS+=    --with-test2=exhaustive
.else
CONFIGURE_ARGS+=    --without-test2
.endif
```

5.13.3.3.3. OPT_CONFIGURE_ON and OPT_CONFIGURE_OFF

When option OPT is selected, the value of OPT_CONFIGURE_ON, if defined, is appended to CONFIGURE_ARGS. OPT_CONFIGURE_OFF works the same way, but when OPT is not selected. For example:

```
OPTIONS_DEFINE= OPT1
OPT1_CONFIGURE_ON=  --add-test
OPT1_CONFIGURE_OFF= --no-test
```

is equivalent to:

```
OPTIONS_DEFINE= OPT1

.include <bsd.port.options.mk>

.if ${PORT_OPTIONS:MOPT1}
  .if OPT1_CONFIGURE_ON
    CONFIGURE_ARGS+=    --add-test
  .else
    CONFIGURE_ARGS+=    --no-test
  .endif

.else
  CONFIGURE_ARGS+=    --no-test
 .endif
```
Most of the time, the helpers in \texttt{OPT\_CONFIGURE\_ENABLE} and \texttt{OPT\_CONFIGURE\_WITH} provide a shorter and more comprehensive functionality.

5.13.3.4. \texttt{CMAKE\_ARGS} Helpers

5.13.3.4.1. \texttt{OPT\_CMAKE\_ON} and \texttt{OPT\_CMAKE\_OFF}

When option \texttt{OPT} is selected, the value of \texttt{OPT\_CMAKE\_ON}, if defined, is appended to \texttt{CMAKE\_ARGS}. \texttt{OPT\_CMAKE\_OFF} works the same way, but when \texttt{OPT} is not selected. For example:

\begin{verbatim}
OPTIONS\_DEFINE= OPT1
OPT1\_CMAKE\_ON= -DTEST:BOOL=true -DDEBUG:BOOL=true
OPT1\_CMAKE\_OFF= -DOPTIMIZE:BOOL=true
\end{verbatim}

is equivalent to:

\begin{verbatim}
OPTIONS\_DEFINE= OPT1
.include <bsd.port.options.mk>
.if \$(PORT\_OPTIONS:MOPT1)
  CMAKE\_ARGS+= -DTEST:BOOL=true -DDEBUG:BOOL=true
.else
  CMAKE\_ARGS+= -DOPTIMIZE:BOOL=true
.endif
\end{verbatim}

See \texttt{OPT\_CMAKE\_BOOL} and \texttt{OPT\_CMAKE\_BOOL\_OFF} for a shorter helper when the value is boolean.

5.13.3.4.2. \texttt{OPT\_CMAKE\_BOOL} and \texttt{OPT\_CMAKE\_BOOL\_OFF}

When option \texttt{OPT} is selected, for each \texttt{entry} in \texttt{OPT\_CMAKE\_BOOL} then \texttt{-D_entry\_:BOOL=true} is appended to \texttt{CMAKE\_ARGS}. When option \texttt{OPT} is not selected, \texttt{-D_entry\_:BOOL=false} is appended to \texttt{CONFIGURE\_ARGS}. \texttt{OPT\_CMAKE\_BOOL\_OFF} is the opposite, \texttt{-D_entry\_:BOOL=false} is appended to \texttt{CMAKE\_ARGS} when the option is selected, and \texttt{-D_entry\_:BOOL=true} when the option is not selected. For example:

\begin{verbatim}
OPTIONS\_DEFINE= OPT1
OPT1\_CMAKE\_BOOL= TEST DEBUG
OPT1\_CMAKE\_BOOL\_OFF= OPTIMIZE
\end{verbatim}

is equivalent to:
OPTIONS_DEFINE= OPT1

.include <bsd.port.options.mk>

.if ${PORT_OPTIONS:MOPT1}
CMAKE_ARGS+= -DTEST:BOOL=true -DDEBUG:BOOL=true 
-DOPTIMIZE:BOOL=false
.else
CMAKE_ARGS+= -DTEST:BOOL=false -DDEBUG:BOOL=false 
-DOPTIMIZE:BOOL=true
.endif

5.13.3.5. **MESON_ARGS Helpers**

5.13.3.5.1. **OPT_MESON_ON and OPT_MESON_OFF**

When option *OPT* is selected, the value of *OPT_MESON_ON*, if defined, is appended to *MESON_ARGS*. *OPT_MESON_OFF* works the same way, but when *OPT* is *not* selected. For example:

```plaintext
OPTIONS_DEFINE= OPT1
OPT1_MESON_ON= -Dopt=1
OPT1_MESON_OFF= -Dopt=2
```

is equivalent to:

```plaintext
OPTIONS_DEFINE= OPT1
.include <bsd.port.options.mk>
.if ${PORT_OPTIONS:MOPT1}
MESON_ARGS+= -Dopt=1
.else
MESON_ARGS+= -Dopt=2
.endif
```

5.13.3.5.2. **OPT_MESON_TRUE and OPT_MESON_FALSE**

When option *OPT* is selected, for each *entry* in *OPT_MESON_TRUE* then `-D_entry_=true` is appended to *MESON_ARGS*. When option *OPT* is *not* selected, `-D_entry_=false` is appended to *MESON_ARGS*. *OPT_MESON_FALSE* is the opposite, `-D_entry_=false` is appended to *MESON_ARGS* when the option is selected, and `-D_entry_=true` when the option is *not* selected. For example:

```plaintext
OPTIONS_DEFINE= OPT1
OPT1_MESON_TRUE= test debug
OPT1_MESON_FALSE= optimize
```
is equivalent to:

```bash
OPTIONS_DEFINE= OPT1
.include <bsd.port.options.mk>
.if ${PORT_OPTIONS:MOPT1}
MESON_ARGS+= -Dtest=true -Ddebug=true \
   -Doptimize=false
.else
MESON_ARGS+= -Dtest=false -Ddebug=false \
   -Doptimize=true
.endif
```

5.13.3.5.3. OPT_MESON_YES and OPT_MESON_NO

When option `OPT` is selected, for each `entry` in `OPT_MESON_YES` then `-D_entry_=yes` is appended to `MESON_ARGS`. When option `OPT` is not selected, `-D_entry_=no` is appended to `MESON_ARGS`. `OPT_MESON_NO` is the opposite, `-D_entry_=no` is appended to `MESON_ARGS` when the option is selected, and `-D_entry_=yes` when the option is not selected. For example:

```bash
OPTIONS_DEFINE= OPT1
OPT1_MESON_YES= test debug
OPT1_MESON_NO=  optimize
```

is equivalent to:

```bash
OPTIONS_DEFINE= OPT1
.include <bsd.port.options.mk>
.if ${PORT_OPTIONS:MOPT1}
MESON_ARGS+= -Dtest=yes -Ddebug=yes \
   -Doptimize=no
.else
MESON_ARGS+= -Dtest=no -Ddebug=no \
   -Doptimize=yes
.endif
```

5.13.3.5.4. OPT_MESON_ENABLED and OPT_MESON_DISABLED

When option `OPT` is selected, for each `entry` in `OPT_MESON_ENABLED` then `-D_entry_=enabled` is appended to `MESON_ARGS`. When option `OPT` is not selected, `-D_entry_=disabled` is appended to `MESON_ARGS`. `OPT_MESON_DISABLED` is the opposite, `-D_entry_=disabled` is appended to `MESON_ARGS` when the option is selected, and `-D_entry_=enabled` when the option is not selected. For example:

```bash
```
OPTIONS_DEFINE= OPT1
OPT1_MESON_ENABLED= test
OPT1_MESON_DISABLED= debug

is equivalent to:

OPTIONS_DEFINE= OPT1
.include <bsd.port.options.mk>
.if ${PORT_OPTIONS:MOPT1}
MESON_ARGS+= -Dtest=enabled -Ddebug=disabled
.else
MESON_ARGS+= -Dtest=disabled -Ddebug=enabled
.endif

5.13.3.6. **OPT_QMAKE_ON and OPT_QMAKE_OFF**

When option *OPT* is selected, the value of *OPT_QMAKE_ON*, if defined, is appended to *QMAKE_ARGS*. *OPT_QMAKE_OFF* works the same way, but when *OPT* is not selected. For example:

OPTIONS_DEFINE= OPT1
OPT1_QMAKE_ON= -DTEST:BOOL=true
OPT1_QMAKE_OFF= -DPRODUCTION:BOOL=true

is equivalent to:

OPTIONS_DEFINE= OPT1
.include <bsd.port.options.mk>
.if ${PORT_OPTIONS:MOPT1}
QMAKE_ARGS+= -DTEST:BOOL=true
.else
QMAKE_ARGS+= -DPRODUCTION:BOOL=true
.endif

5.13.3.7. **OPT_IMPLIES**

Provides a way to add dependencies between options.

When *OPT* is selected, all the options listed in this variable will be selected too. Using the **OPT_CONFIGURE_ENABLE** described earlier to illustrate:
OPTIONS_DEFINE= OPT1 OPT2
OPT1_IMPLIES= OPT2

OPT1_CONFIGURE_ENABLE= opt1
OPT2_CONFIGURE_ENABLE= opt2

Is equivalent to:

OPTIONS_DEFINE= OPT1 OPT2

.include <bsd.port.options.mk>

.if ${PORT_OPTIONS:MOPT1}
 CONFIGURE_ARGS+= --enable-opt1
.else
 CONFIGURE_ARGS+= --disable-opt1
.endif

.if ${PORT_OPTIONS:MOPT2} || ${PORT_OPTIONS:MOPT1}
 CONFIGURE_ARGS+= --enable-opt2
.else
 CONFIGURE_ARGS+= --disable-opt2
.endif

例 47. Simple Use of OPT_IMPLIES

This port has a X11 option, and a GNOME option that needs the X11 option to be selected to build.

OPTIONS_DEFINE= X11 GNOME
OPTIONS_DEFAULT=    X11

X11_USES=   xorg
X11_USE=    xorg=xi,xextproto
GNOME_USE=  gnome=gtk30
GNOME_IMPLIES= X11

5.13.3.8. OPT_PREVENTS and OPT_PREVENTS_MSG

Provides a way to add conflicts between options.

When OPT is selected, all the options listed in OPT_PREVENTS must be un-selected. If OPT_PREVENTS_MSG is set and a conflict is triggered, its content will be shown explaining why they conflict. For example:
OPTIONS_DEFINE= OPT1 OPT2
OPT1_PREVENTS= OPT2
OPT1_PREVENTS_MSG= OPT1 and OPT2 enable conflicting options

Is roughly equivalent to:

OPTIONS_DEFINE= OPT1 OPT2

.include <bsd.port.options.mk>

.if ${PORT_OPTIONS:MOPT2} && ${PORT_OPTIONS:MOPT1}
BROKEN= Option OPT1 conflicts with OPT2 (select only one)
.endif

The only difference is that the first one will write an error after running `make config`, suggesting changing the selected options.

Example 48. Simple Use of `OPT_PREVENTS`

This port has `X509` and `SCTP` options. Both options add patches, but the patches conflict with each other, so they cannot be selected at the same time.

OPTIONS_DEFINE= X509 SCTP

SCTP_PATCHFILES= ${PORTNAME}-6.8p1-sctp-2573.patch.gz:-p1
SCTP_CONFIGURE_WITH= sctp

X509_PATCH_SITES= http://www.roumenpetrov.info/openssh/x509/:x509
X509_PATCHFILES= ${PORTNAME}-7.0p1+x509-8.5.diff.gz:-p1:x509
X509_PREVENTS= SCTP
X509_PREVENTS_MSG= X509 and SCTP patches conflict

5.13.3.9. `OPT_VARS` and `OPT_VARS_OFF`

Provides a generic way to set and append to variables.

Before using `OPT_VARS` and `OPT_VARS_OFF`, see if there is already a more specific helper available in `Generic Variables Replacement`, `OPT_VARIABLE` and `OPT_VARIABLE_OFF`.

When option `OPT` is selected, and `OPT_VARS` defined, `key=value` and `key+=value` pairs are evaluated from `OPT_VARS`. An `=` cause the existing value of `KEY` to be overwritten, an `+=` appends to the value. `OPT_VARS_OFF` works the same way, but when `OPT` is not selected.
OPTIONS_DEFINE= OPT1 OPT2 OPT3
OPT1_VARS=  also_build+=bin1
OPT2_VARS=  also_build+=bin2
OPT3_VARS=  bin3_build=yes
OPT3_VARS_OFF=  bin3_build=no

MAKE_ARGS=  ALSO_BUILD="${ALSO_BUILD}" BIN3_BUILD="${BIN3_BUILD}"

is equivalent to:

OPTIONS_DEFINE= OPT1 OPT2

MAKE_ARGS=  ALSO_BUILD="${ALSO_BUILD}" BIN3_BUILD="${BIN3_BUILD}"

.include <bsd.port.options.mk>

.if ${PORT_OPTIONS:MOPT1}
ALSO_BUILD+=    bin1
.endif

.if ${PORT_OPTIONS:MOPT2}
ALSO_BUILD+=    bin2
.endif

.if ${PORT_OPTIONS:MOPT2}
BIN3_BUILD= yes
.else
BIN3_BUILD= no
.endif

Values containing whitespace must be enclosed in quotes:

OPT_VARS=  foo="bar baz"

This is due to the way make(1) variable expansion deals with whitespace. When
OPT_VARS=  foo=bar baz is expanded, the variable ends up containing two strings,
foo=bar and baz. But the submitter probably intended there to be only one string,
foo=bar baz. Quoting the value prevents whitespace from being used as a
delimiter.

Also, do not add extra spaces after the var= sign and before the value, it would also
be split into two strings. This will not work:

OPT_VARS=  foo=    bar
5.13.3.10. Dependencies, **OPT DEPTYPE** and **OPT DEPTYPE OFF**

For any of these dependency types:

- `PKG_DEPENDS`
- `EXTRACT_DEPENDS`
- `PATCH_DEPENDS`
- `FETCH_DEPENDS`
- `BUILD_DEPENDS`
- `LIB_DEPENDS`
- `RUN_DEPENDS`

When option **OPT** is selected, the value of **OPT DEPTYPE**, if defined, is appended to **DEPTYPE**. **OPT DEPTYPE OFF** works the same, but when **OPT** is not selected. For example:

```makefile
OPTIONS_DEFINE= OPT1
OPT1_LIB_DEPENDS= liba.so:devel/a
OPT1_LIB_DEPENDS_OFF= libb.so:devel/b
```

is equivalent to:

```makefile
OPTIONS_DEFINE= OPT1
.include <bsd.port.options.mk>
.if ${PORT_OPTIONS:MOPT1}
LIB_DEPENDS+= liba.so:devel/a
.else
LIB_DEPENDS+= libb.so:devel/b
.endif
```

5.13.3.11. Generic Variables Replacement, **OPT_VARIABLE** and **OPT_VARIABLE_OFF**

For any of these variables:

- `ALL_TARGET`
- `BINARIES_ALIAS`
- `BROKEN`
- `CATEGORIES`
- `CFLAGS`
- `CONFIGURE_ENV`
- `CONFLICTS`
- `CONFLICTS_BUILD`
• CONFLICTS_INSTALL
• CPPFLAGS
• CXXFLAGS
• DESKTOP_ENTRIES
• DISTFILES
• EXTRACT_ONLY
• EXTRA_PATCHES
• GH_ACCOUNT
• GH_PROJECT
• GH_SUBDIR
• GH_TAGNAME
• GH_TUPLE
• GL_ACCOUNT
• GL_COMMIT
• GL_PROJECT
• GL_SITE
• GL_SUBDIR
• GL_TUPLE
• IGNORE
• INFO
• INSTALL_TARGET
• LDFLAGS
• LIBS
• MAKE_ARGS
• MAKE_ENV
• MASTER_SITES
• PATCHFILES
• PATCH_SITES
• PLIST_DIRS
• PLIST_FILES
• PLIST_SUB
• PORTDOCS
• PORTEXAMPLES
• SUB_FILES
• SUB_LIST
When option \textit{OPT} is selected, the value of \texttt{OPT\_ABOVE\_VARIABLE}, if defined, is appended to \texttt{ABOVE\_VARIABLE}. \texttt{OPT\_ABOVE\_VARIABLE\_OFF} works the same way, but when \texttt{OPT} is not selected. For example:

\begin{verbatim}
OPTIONS_DEFINE= OPT1
OPT1\_USES= gmake
OPT1\_CFLAGS\_OFF= -DTEST
\end{verbatim}

is equivalent to:

\begin{verbatim}
OPTIONS_DEFINE= OPT1
.include <bsd.port.options.mk>
.if ${PORT\_OPTIONS:MOPT1}
USES+= gmake
.else
CFLAGS+= -DTEST
.endif
\end{verbatim}

Some variables are not in this list, in particular \texttt{PKGNAMEPREFIX} and \texttt{PKGNAMESUFFIX}. This is intentional. A port must not change its name when its option set changes.

Some of these variables, at least \texttt{ALL\_TARGET}, \texttt{DISTFILES} and \texttt{INSTALL\_TARGET}, have their default values set after the options are processed.

With these lines in the Makefile:

\begin{verbatim}
ALL\_TARGET= all
DOCS\_ALL\_TARGET= doc
\end{verbatim}

If the \texttt{DOCS} option is enabled, \texttt{ALL\_TARGET} will have a final value of \texttt{all doc}; if the option is disabled, it would have a value of \texttt{all}.

With only the options helper line in the Makefile:

\begin{verbatim}
DOCS\_ALL\_TARGET= doc
\end{verbatim}

If the \texttt{DOCS} option is enabled, \texttt{ALL\_TARGET} will have a final value of \texttt{doc}; if the option is disabled, it would have a value of \texttt{all}. 108
5.13.3.12. Additional Build Targets, target-\textit{OPT-on} and target-\textit{OPT-off}

These Makefile targets can accept optional extra build targets:

- pre-fetch
- do-fetch
- post-fetch
- pre-extract
- do-extract
- post-extract
- pre-patch
- do-patch
- post-patch
- pre-configure
- do-configure
- post-configure
- pre-build
- do-build
- post-build
- pre-install
- do-install
- post-install
- post-stage
- pre-package
- do-package
- post-package

When option \textit{OPT} is selected, the target target-\textit{OPT-on}, if defined, is executed after target. target-\textit{OPT-off} works the same way, but when \textit{OPT} is not selected. For example:

\begin{verbatim}
OPTIONS_DEFINE= OPT1

post-patch-OPT1-on:
  @${REINPLACE_CMD} -e '/opt1/s|/usr/bin/|${EXAMPLESDIR}/|' ${WRKSRC}/Makefile

post-patch-OPT1-off:
  @${REINPLACE_CMD} -e '/opt1/s|/usr/bin/|${PREFIX}/bin/|' ${WRKSRC}/Makefile
\end{verbatim}

is equivalent to:
OPTIONS_DEFINE= OPT1

.include <bsd.port.options.mk>

post-patch:
.ifdef ${PORT_OPTIONS:MOPT1}
  @${REINPLACE_CMD} -e '/opt1/s|/usr/bin/|${EXAMPLESDIR}/|' ${WRKSRC}/Makefile
.else
  @${REINPLACE_CMD} -e '/opt1/s|/usr/bin/|${PREFIX}/bin/|' ${WRKSRC}/Makefile
.endif

Each port is extracted into a working directory, which must be writable. The ports system defaults to having DISTFILES unpack in to a directory called ${DISTNAME}. In other words, if the Makefile has:

```
PORTNAME= foo
DISTVERSION= 1.0
```

then the port's distribution files contain a top-level directory, foo-1.0, and the rest of the files are located under that directory.

A number of variables can be overridden if that is not the case.

5.14.1. WRKSRC

The variable lists the name of the directory that is created when the application’s distfiles are extracted. If our previous example extracted into a directory called foo (and not foo-1.0) write:

```
WRKSRC= ${WRKDIR}/foo
```

or possibly

```
WRKSRC= ${WRKDIR}/${PORTNAME}
```

5.14.2. WRKSRC_SUBDIR

If the source files needed for the port are in a subdirectory of the extracted distribution file, set WRKSRC_SUBDIR to that directory.

```
WRKSRC_SUBDIR= src
```
5.14.3. **NO_WRKSUBDIR**

If the port does not extract into a subdirectory at all, then set `NO_WRKSUBDIR` to indicate that.

```
NO_WRKSUBDIR= yes
```

Because `WRKDIR` is the only directory that is supposed to be writable during the build, and is used to store many files recording the status of the build, the port's extraction will be forced into a subdirectory.

5.15. **Conflict Handling**

There are three different variables to register a conflict between packages and ports: `CONFLICTS`, `CONFLICTS_INSTALL` and `CONFLICTS_BUILD`.

The conflict variables automatically set the variable `IGNORE`, which is more fully documented in Marking a Port Not Installable with `BROKEN`.

When removing one of several conflicting ports, it is advisable to retain `CONFLICTS` in those other ports for a few months to cater for users who only update once in a while.

**CONFLICTS_INSTALL**

If the package cannot coexist with other packages (because of file conflicts, runtime incompatibilities, etc.). `CONFLICTS_INSTALL` check is done after the build stage and prior to the install stage.

**CONFLICTS_BUILD**

If the port cannot be built when other specific ports are already installed. Build conflicts are not recorded in the resulting package.

**CONFLICTS**

If the port cannot be built if a certain port is already installed and the resulting package cannot coexist with the other package. `CONFLICTS` check is done prior to the build stage and prior to the install stage.

The most common content of one of these variable is the package base of another port. The package base is the package name without the appended version, it can be obtained by running `make -V PKGBASE`. 
**Basic usage of CONFLICTS**

dns/bind99 cannot be installed if dns/bind910 is present because they install same files. First gather the package base to use:

```
% make -C dns/bind99 -V PKGBASE
  bind99
% make -C dns/bind910 -V PKGBASE
  bind910
```

Then add to the Makefile of dns/bind99:

```
CONFLICTS_INSTALL= bind910
```

And add to the Makefile of dns/bind910:

```
CONFLICTS_INSTALL= bind99
```

Sometimes, only certain versions of another port are incompatible. When this is the case, use the full package name including the version. If necessary, use shell globs like * and ? so that all necessary versions are matched.

**Using CONFLICTS With Globs.**

From versions from 2.0 and up-to 2.4.1_2, deskutils/gnotime used to install a bundled version of databases/qof.

To reflect this past, the Makefile of databases/qof contains:

```
CONFLICTS_INSTALL= gnotime-2.[0-3]* \ 
  gnotime-2.4.0* gnotime-2.4.1 \ 
  gnotime-2.4.1_[12]
```

The first entry match versions 2.0 through 2.3, the second all the revisions of 2.4.0, the third the exact 2.4.1 version, and the last the first and second revisions of the 2.4.1 version.

deskutils/gnotime does not have any conflicts line because its current version does not conflict with anything else.

The variable DISABLE_CONFLICTS may be temporarily set when making targets that are not affected by conflicts. The variable is not to be set in port Makefiles.

```
% make -DDISABLE_CONFLICTS patch
```
5.16. Installing Files

The install phase is very important to the end user because it adds files to their system. All the additional commands run in the port Makefile's *-install targets should be echoed to the screen. Do not silence these commands with @ or .SILENT.

5.16.1. INSTALL_* Macros

Use the macros provided in bsd.port.mk to ensure correct modes of files in the port's *-install targets. Set ownership directly in pkg-plist with the corresponding entries, such as @((owner,group,)), @owner owner, and @group group. These operators work until overridden, or until the end of pkg-plist, so remember to reset them after they are no longer needed. The default ownership is root:wheel. See Base Keywords for more information.

- INSTALL_PROGRAM is a command to install binary executables.
- INSTALL_SCRIPT is a command to install executable scripts.
- INSTALL_LIB is a command to install shared libraries (but not static libraries).
- INSTALL_KLD is a command to install kernel loadable modules. Some architectures do not like having the modules stripped, so use this command instead of INSTALL_PROGRAM.
- INSTALL_DATA is a command to install sharable data, including static libraries.
- INSTALL_MAN is a command to install manpages and other documentation (it does not compress anything).

These variables are set to the install(1) command with the appropriate flags for each situation.

Do not use INSTALL_LIB to install static libraries, because stripping them renders them useless. Use INSTALL_DATA instead.

5.16.2. Stripping Binaries and Shared Libraries

Installed binaries should be stripped. Do not strip binaries manually unless absolutely required. The INSTALL_PROGRAM macro installs and strips a binary at the same time. The INSTALL_LIB macro does the same thing to shared libraries.

When a file must be stripped, but neither INSTALL_PROGRAM nor INSTALL_LIB macros are desirable, ${STRIP_CMD} strips the program or shared library. This is typically done within the post-install target. For example:

```
post-install:
    ${STRIP_CMD} ${STAGEDIR}${PREFIX}/bin/xdl
```

When multiple files need to be stripped:
Use `file(1)` on a file to determine if it has been stripped. Binaries are reported by `file(1)` as stripped, or not stripped. Additionally, `strip(1)` will detect programs that have already been stripped and exit cleanly.

When `WITH_DEBUG` is defined, elf files must not be stripped.

The variables (`STRIP_CMD`, `INSTALL_PROGRAM`, `INSTALL_LIB`, ...) and `USES` provided by the framework handle this automatically.

Some software, add `-s` to their `LDFLAGS`, in this case, either remove `-s` if `WITH_DEBUG` is set, or remove it unconditionally and use `STRIP_CMD` in `post-install`.

### 5.16.3. Installing a Whole Tree of Files

Sometimes, a large number of files must be installed while preserving their hierarchical organization. For example, copying over a whole directory tree from `WRKSRC` to a target directory under `PREFIX`. Note that `PREFIX`, `EXAMPLESDIR`, `DATADIR`, and other path variables must always be prepended with `STAGEDIR` to respect staging (see Staging).

Two macros exist for this situation. The advantage of using these macros instead of `cp` is that they guarantee proper file ownership and permissions on target files. The first macro, `COPYTREE_BIN`, will set all the installed files to be executable, thus being suitable for installing into `PREFIX/bin`. The second macro, `COPYTREE_SHARE`, does not set executable permissions on files, and is therefore suitable for installing files under `PREFIX/share` target.

```makefile
post-install:
  ${MKDIR} ${STAGEDIR}${EXAMPLESDIR}
  (cd ${WRKSRC}/examples && ${COPYTREE_SHARE} . ${STAGEDIR}${EXAMPLESDIR})
```

This example will install the contents of the examples directory in the vendor distfile to the proper examples location of the port.

```makefile
post-install:
  ${MKDIR} ${STAGEDIR}${DATADIR}/summer
  (cd ${WRKSRC}/temperatures & & ${COPYTREE_SHARE} "June July August" ${STAGEDIR}${DATADIR}/summer)
```

And this example will install the data of summer months to the summer subdirectory of a DATADIR.

Additional `find` arguments can be passed via the third argument to `COPYTREE_*` macros. For example, to install all files from the first example except Makefiles, one can use these commands.
These macros do not add the installed files to pkg-plist. They must be added manually. For optional documentation (PORTDOCS, see Install Additional Documentation) and examples (PORTEXAMPLES), the %%PORTDOCS%% or %%PORTEXAMPLES%% prefixes must be prepended in pkg-plist.

5.16.4. Install Additional Documentation

If the software has some documentation other than the standard man and info pages that is useful for the user, install it under DOCSDIR. This can be done, like the previous item, in the post-install target.

Create a new directory for the port. The directory name is DOCSDIR. This usually equals PORTNAME. However, if the user might want different versions of the port to be installed at the same time, the whole PKGNAME can be used.

Since only the files listed in pkg-plist are installed, it is safe to always install documentation to STAGEDIR (see Staging). Hence .if blocks are only needed when the installed files are large enough to cause significant I/O overhead.

On the other hand, if there is a DOCS option in the port, install the documentation in a post-install-DOCS-on target. These targets are described in Additional Build Targets, target-OPT-on and target-OPT-off.

Here are some handy variables and how they are expanded by default when used in the Makefile:

- DATADIR gets expanded to PREFIX/shared/PORTNAME.
- DATADIR_REL gets expanded to share/PORTNAME.
- DOCSDIR gets expanded to PREFIX/shared/doc/PORTNAME.
- DOCSDIR_REL gets expanded to share/doc/PORTNAME.
- EXAMPLESDIR gets expanded to PREFIX/shared/examples/PORTNAME.
- EXAMPLESDIR_REL gets expanded to share/examples/PORTNAME.

The DOCS option only controls additional documentation installed in DOCSDIR. It does not apply to standard man pages and info pages. Things installed in EXAMPLESDIR are controlled by the EXAMPLES option.

These variables are exported to PLIST_SUB. Their values will appear there as pathnames relative to
PREFIX if possible. That is, share/doc/PORTNAME will be substituted for `%DOCSDIR%` in the packing list by default, and so on. (See more on pkg-plist substitution here.)

All conditionally installed documentation files and directories are included in pkg-plist with the `%%PORTDOCS%%` prefix, for example:

```text
%%PORTDOCS%%%%DOCSDIR%/AUTHORS
%%PORTDOCS%%%%DOCSDIR%/CONTACT
```

As an alternative to enumerating the documentation files in pkg-plist, a port can set the variable `PORTDOCS` to a list of file names and shell glob patterns to add to the final packing list. The names will be relative to `DOCSDIR`. Therefore, a port that utilizes `PORTDOCS`, and uses a non-default location for its documentation, must set `DOCSDIR` accordingly. If a directory is listed in `PORTDOCS` or matched by a glob pattern from this variable, the entire subtree of contained files and directories will be registered in the final packing list. If the `DOCS` option has been unset then files and directories listed in `PORTDOCS` would not be installed or added to port packing list. Installing the documentation at `PORTDOCS` as shown above remains up to the port itself. A typical example of utilizing `PORTDOCS`:

```text
PORTDOCS= README.* ChangeLog docs/*
```

The equivalents of `PORTDOCS` for files installed under `DATADIR` and `EXAMPLESDIR` are `PORTDATA` and `PORTEXAMPLES`, respectively.

The contents of `pkg-message` are displayed upon installation. See the section on using `pkg-message` for details. `pkg-message` does not need to be added to pkg-plist.

### 5.16.5. Subdirectories Under `PREFIX`

Try to let the port put things in the right subdirectories of `PREFIX`. Some ports lump everything and put it in the subdirectory with the port's name, which is incorrect. Also, many ports put everything except binaries, header files and manual pages in a subdirectory of `lib`, which does not work well with the BSD paradigm. Many of the files must be moved to one of these directories: `etc` (setup/configuration files), `libexec` (executables started internally), `sbin` (executables for superusers/managers), `info` (documentation for info browser) or `share` (architecture independent files). See `hier(7)` for details; the rules governing `/usr` pretty much apply to `/usr/local` too. The exception are ports dealing with USENET "news". They may use `PREFIX/news` as a destination for their files.

### 5.17. Use `BINARY_ALIAS` to Rename Commands Instead of Patching the Build

When `BINARY_ALIAS` is defined it will create symlinks of the given commands in a directory which will be prepended to `PATH`.

Use it to substitute hardcoded commands the build phase relies on without having to patch any
Some ports expect `sed` to behave like GNU sed and use features that `sed(1)` does not provide. GNU sed is available from `textproc/gsed` on FreeBSD.

Use `BINARY_ALIAS` to substitute `sed` with `gsed` for the duration of the build:

```makefile
BUILD_DEPENDS= gsed: textproc/gsed
... BINARY_ALIAS= sed=gsed
```

A port that has a hardcoded reference to `python3` in its build scripts will need to have it available in `PATH` at build time. Use `BINARY_ALIAS` to create an alias that points to the right Python 3 binary:

```makefile
USES= python:3.4+, build
... BINARY_ALIAS= python3=${PYTHON_CMD}
```

See [Using Python](#) for more information about `USES=python`.

Binary aliases are created after the dependencies provided via `BUILD_DEPENDS` and `LIB_DEPENDS` are processed and before the `configure` target. This leads to various limitations. For example, programs installed via `TEST_DEPENDS` cannot be used to create a binary alias as test dependencies specified this way are processed after binary aliases are created.
Chapter 6. Special Considerations

This section explains the most common things to consider when creating a port.

6.1. Staging

bsd.port.mk expects ports to work with a "stage directory". This means that a port must not install files directly to the regular destination directories (that is, under PREFIX, for example) but instead into a separate directory from which the package is then built. In many cases, this does not require root privileges, making it possible to build packages as an unprivileged user. With staging, the port is built and installed into the stage directory, STAGEDIR. A package is created from the stage directory and then installed on the system. Automake tools refer to this concept as DESTDIR, but in FreeBSD, DESTDIR has a different meaning (see PREFIX and DESTDIR).

No port really needs to be root. It can mostly be avoided by using USES=uidfix. If the port still runs commands like chown(8), chgrp(1), or forces owner or group with install(1) then use USES=fakeroot to fake those calls. Some patching of the port's Makefiles will be needed.

Meta ports, or ports that do not install files themselves but only depend on other ports, must avoid needlessly extracting the mtree(8) to the stage directory. This is the basic directory layout of the package, and these empty directories will be seen as orphans. To prevent mtree(8) extraction, add this line:

```
NO_MTREE= yes
```

Meta ports should use USES=metaport. It sets up defaults for ports that do not fetch, build, or install anything.

Staging is enabled by prepending STAGEDIR to paths used in the pre-install, do-install, and post-install targets (see the examples through the book). Typically, this includes PREFIX, ETCDIR, DATADIR, EXAMPLESDIR, MANPREFIX, DOCSDIR, and so on. Directories should be created as part of the post-install target. Avoid using absolute paths whenever possible.

Ports that install kernel modules must prepend STAGEDIR to their destination, by default /boot/modules.

6.1.1. Handling Symbolic Links

When creating a symbolic link, relative ones are strongly recommended. Use $RLN to create relative symbolic links. It uses install(1) under the hood to automatically figure out the relative link to create.
Create Relative Symbolic Links Automatically

\$\text{(RLN)} \text{ uses } \text{install(1)}'s \text{relative} \text{symbolic} \text{feature which frees the porter of computing the relative path.}

\$\text{(RLN)} \text{ $\{\text{STAGEDIR}\}$$\{\text{PREFIX}\}/\text{lib/libfoo.so.42} $\{\text{STAGEDIR}\}$$\{\text{PREFIX}\}/\text{lib/libfoo.so}
\$\text{(RLN)} \text{ $\{\text{STAGEDIR}\}$$\{\text{PREFIX}\}/\text{libexec/foo/bar} $\{\text{STAGEDIR}\}$$\{\text{PREFIX}\}/\text{bin/bar}
\$\text{(RLN)} \text{ $\{\text{STAGEDIR}\}/\text{var/cache/foo} $\{\text{STAGEDIR}\}$$\{\text{PREFIX}\}/\text{share/foo}

Will generate:

\%
ls -lF $\{\text{STAGEDIR}\}$$\{\text{PREFIX}\}/\text{lib}
lwxr-xr-x 1 nobody nobody 181 Aug  3 11:27 libfoo.so@ -> libfoo.so.42
-w-xr-xr-x 1 nobody nobody 15 Aug  3 11:24 libfoo.so.42*
%
ls -lF $\{\text{STAGEDIR}\}$$\{\text{PREFIX}\}/\text{bin}
lwxr-xr-x 1 nobody nobody 181 Aug  3 11:27 bar@ -> ../libexec/foo/bar
%
ls -lF $\{\text{STAGEDIR}\}$$\{\text{PREFIX}\}/\text{share}
lwxr-xr-x 1 nobody nobody 181 Aug  3 11:27 foo@ -> ../../../var/cache/foo

6.2. Bundled Libraries

This section explains why bundled dependencies are considered bad and what to do about them.

6.2.1. Why Bundled Libraries Are Bad

Some software requires the porter to locate third-party libraries and add the required dependencies to the port. Other software bundles all necessary libraries into the distribution file. The second approach seems easier at first, but there are some serious drawbacks:

This list is loosely based on the Fedora and Gentoo wikis, both licensed under the CC-BY-SA 3.0 license.

Security

If vulnerabilities are found in the upstream library and fixed there, they might not be fixed in the library bundled with the port. One reason could be that the author is not aware of the problem. This means that the porter must fix them, or upgrade to a non-vulnerable version, and send a patch to the author. This all takes time, which results in software being vulnerable longer than necessary. This in turn makes it harder to coordinate a fix without unnecessarily leaking information about the vulnerability.

Bugs

This problem is similar to the problem with security in the last paragraph, but generally less severe.

Forking

It is easier for the author to fork the upstream library once it is bundled. While convenient on
first sight, it means that the code diverges from upstream making it harder to address security or other problems with the software. A reason for this is that patching becomes harder.

Another problem of forking is that because code diverges from upstream, bugs get solved over and over again instead of just once at a central location. This defeats the idea of open source software in the first place.

Symbol collision
When a library is installed on the system, it might collide with the bundled version. This can cause immediate errors at compile or link time. It can also cause errors when running the program which might be harder to track down. The latter problem could be caused because the versions of the two libraries are incompatible.

Licensing
When bundling projects from different sources, license issues can arise more easily, especially when licenses are incompatible.

Waste of resources
Bundled libraries waste resources on several levels. It takes longer to build the actual application, especially if these libraries are already present on the system. At run-time, they can take up unnecessary memory when the system-wide library is already loaded by one program and the bundled library is loaded by another program.

Waste of effort
When a library needs patches for FreeBSD, these patches have to be duplicated again in the bundled library. This wastes developer time because the patches might not apply cleanly. It can also be hard to notice that these patches are required in the first place.

6.2.2. What to do About Bundled Libraries
Whenever possible, use the unbundled version of the library by adding a \texttt{LIB_DEPENDS} to the port. If such a port does not exist yet, consider creating it.

Only use bundled libraries if the upstream has a good track record on security and using unbundled versions leads to overly complex patches.

\begin{itemize}
\item In some very special cases, for example emulators, like Wine, a port has to bundle libraries, because they are in a different architecture, or they have been modified to fit the software’s use. In that case, those libraries should not be exposed to other ports for linking. Add \texttt{BUNDLE_LIBS=yes} to the port’s Makefile. This will tell \texttt{pkg(8)} to not compute provided libraries. Always ask the Ports Management Team \texttt{<portmgr@FreeBSD.org>} before adding this to a port.
\end{itemize}

6.3. Shared Libraries
If the port installs one or more shared libraries, define a \texttt{USE_LDCONFIG} make variable, which will instruct a bsd.port.mk to run $LDCONFIG \ -m on the directory where the new library is installed (usually PREFIX/lib) during \texttt{post-install} target to register it into the shared library cache. This
variable, when defined, will also facilitate addition of an appropriate `@exec /sbin/ldconfig -m` and `@unexec /sbin/ldconfig -R` pair into pkg-plist, so that a user who installed the package can start using the shared library immediately and de-installation will not cause the system to still believe the library is there.

```
USE_LDCONFIG=   yes
```

The default directory can be overridden by setting `USE_LDCONFIG` to a list of directories into which shared libraries are to be installed. For example, if the port installs shared libraries into `PREFIX/lib/foo` and `PREFIX/lib/bar` use this in Makefile:

```
USE_LDCONFIG=   ${PREFIX}/lib/foo ${PREFIX}/lib/bar
```

Please double-check, often this is not necessary at all or can be avoided through `-rpath` or setting `LD_RUN_PATH` during linking (see `lang/mosml` for an example), or through a shell-wrapper which sets `LD_LIBRARY_PATH` before invoking the binary, like `www/seamonkey` does.

When installing 32-bit libraries on a 64-bit system, use `USE_LDCONFIG32` instead.

If the software uses `autotools`, and specifically `libtool`, add `USES=libtool`.

When the major library version number increments in the update to the new port version, all other ports that link to the affected library must have their `PORTREVISION` incremented, to force recompilation with the new library version.

### 6.4. Ports with Distribution Restrictions or Legal Concerns

Licenses vary, and some of them place restrictions on how the application can be packaged, whether it can be sold for profit, and so on.

It is the responsibility of a porter to read the licensing terms of the software and make sure that the FreeBSD project will not be held accountable for violating them by redistributing the source or compiled binaries either via FTP/HTTP or CD-ROM. If in doubt, please contact the FreeBSD ports 郵件論壇.

In situations like this, the variables described in the next sections can be set.

#### 6.4.1. NO_PACKAGE

This variable indicates that we may not generate a binary package of the application. For instance, the license may disallow binary redistribution, or it may prohibit distribution of packages created from patched sources.

However, the port's `DISTFILES` may be freely mirrored on FTP/HTTP. They may also be distributed on a CD-ROM (or similar media) unless `NO_CDROM` is set as well.
If the binary package is not generally useful, and the application must always be compiled from the source code, use **NO_PACKAGE**. For example, if the application has configuration information that is site specific hard coded into it at compile time, set **NO_PACKAGE**.

Set **NO_PACKAGE** to a string describing the reason why the package cannot be generated.

### 6.4.2. NO_CDROM

This variable alone indicates that, although we are allowed to generate binary packages, we may put neither those packages nor the port's **DISTFILES** onto a CD-ROM (or similar media) for resale. However, the binary packages and the port's **DISTFILES** will still be available via FTP/HTTP.

If this variable is set along with **NO_PACKAGE**, then only the port's **DISTFILES** will be available, and only via FTP/HTTP.

Set **NO_CDROM** to a string describing the reason why the port cannot be redistributed on CD-ROM. For instance, use this if the port's license is for "non-commercial" use only.

### 6.4.3. NOFETCHFILES

Files defined in **NOFETCHFILES** are not fetchable from any of **MASTER_SITES**. An example of such a file is when the file is supplied on CD-ROM by the vendor.

Tools which check for the availability of these files on **MASTER_SITES** have to ignore these files and not report about them.

### 6.4.4. RESTRICTED

Set this variable alone if the application's license permits neither mirroring the application's **DISTFILES** nor distributing the binary package in any way.

Do not set **NO_CDROM** or **NO_PACKAGE** along with **RESTRICTED**, since the latter variable implies the former ones.

Set **RESTRICTED** to a string describing the reason why the port cannot be redistributed. Typically, this indicates that the port contains proprietary software and that the user will need to manually download the **DISTFILES**, possibly after registering for the software or agreeing to accept the terms of an EULA.

### 6.4.5. RESTRICTED_FILES

When **RESTRICTED** or **NO_CDROM** is set, this variable defaults to **${DISTFILES} ${PATCHFILES}**; otherwise it is empty. If only some of the distribution files are restricted, then set this variable to list them.

### 6.4.6. LEGAL_TEXT

If the port has legal concerns not addressed by the above variables, set **LEGAL_TEXT** to a string explaining the concern. For example, if special permission was obtained for FreeBSD to redistribute the binary, this variable must indicate so.
6.4.7. /usr/ports/LEGAL and LEGAL

A port which sets any of the above variables must also be added to /usr/ports/LEGAL. The first column is a glob which matches the restricted distfiles. The second column is the port's origin. The third column is the output of `make -VLEGAL`.

6.4.8. Examples

The preferred way to state "the distfiles for this port must be fetched manually" is as follows:

```
if !exists(${DISTDIR}/${DISTNAME}${EXTRACT_SUFX})
  IGNORE= may not be redistributed because of licensing reasons. Please visit some-
  website to accept their license and download ${DISTFILES} into ${DISTDIR}
.endif
```

This both informs the user, and sets the proper metadata on the user's machine for use by automated programs.

Note that this stanza must be preceded by an inclusion of bsd.port.pre.mk.

6.5. Building Mechanisms

6.5.1. Building Ports in Parallel

The FreeBSD ports framework supports parallel building using multiple `make` sub-processes, which allows SMP systems to utilize all of their available CPU power, allowing port builds to be faster and more effective.

This is achieved by passing `-jX` flag to `make(1)` running on vendor code. This is the default build behavior of ports. Unfortunately, not all ports handle parallel building well and it may be required to explicitly disable this feature by adding the `MAKE_JOBS_UNSAFE=yes` variable. It is used when a port is known to be broken with `-jX` due to race conditions causing intermittent build failures.

When setting `MAKE_JOBS_UNSAFE`, it is very important to explain either with a comment in the Makefile, or at least in the commit message, why the port does not build when enabling. Otherwise, it is almost impossible to either fix the problem, or test if it has been fixed when committing an update at a later date.

6.5.2. make, gmake, and imake

Several differing `make` implementations exist. Ported software often requires a particular implementation, like GNU `make`, known in FreeBSD as `gmake`.

If the port uses GNU make, add `gmake` to `USES`.

`MAKE_CMD` can be used to reference the specific command configured by the `USES` setting in the port's Makefile. Only use `MAKE_CMD` within the application Makefiles in `WRKSRC` to call the `make` implementation expected by the ported software.
If the port is an X application that uses imake to create Makefiles from Imakefiles, set `USES= imake`. See the `USES=imake` section of Using USES Macros for more details.

If the port's source Makefile has something other than `all` as the main build target, set `ALL_TARGET` accordingly. The same goes for `install` and `INSTALL_TARGET`.

### 6.5.3. configure Script

If the port uses the `configure` script to generate Makefile from Makefile.in, set `GNU_CONFIGURE=yes`. To give extra arguments to the `configure` script (the default argument is `--prefix=${PREFIX} --infodir=${PREFIX}/${INFO_PATH} --mandir=${MANPREFIX}/man --build=${CONFIGURE_TARGET}`), set those extra arguments in `CONFIGURE_ARGS`. Extra environment variables can be passed using `CONFIGURE_ENV`.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Means</th>
</tr>
</thead>
<tbody>
<tr>
<td>GNU_CONFIGURE</td>
<td>The port uses <code>configure</code> script to prepare build.</td>
</tr>
<tr>
<td>HAS_CONFIGURE</td>
<td>Same as <code>GNU_CONFIGURE</code>, except default configure target is not added to <code>CONFIGURE_ARGS</code>.</td>
</tr>
<tr>
<td>CONFIGURE_ARGS</td>
<td>Additional arguments passed to <code>configure</code> script.</td>
</tr>
<tr>
<td>CONFIGURE_ENV</td>
<td>Additional environment variables to be set for <code>configure</code> script run.</td>
</tr>
<tr>
<td>CONFIGURE_TARGET</td>
<td>Override default configure target. Default value is <code>${MACHINE_ARCH}-portbld-freebsd${OSREL}</code>.</td>
</tr>
</tbody>
</table>

### 6.5.4. Using cmake

For ports that use CMake, define `USES= cmake`.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Means</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMaket_ARGS</td>
<td>Port specific CMake flags to be passed to the <code>cmake</code> binary.</td>
</tr>
<tr>
<td>CMaket_ON</td>
<td>For each entry in <code>CMaket_ON</code>, an enabled boolean value is added to <code>CMaket_ARGS</code>. See <code>CMaket_ON</code> and <code>CMaket_OFF</code>.</td>
</tr>
<tr>
<td>CMaket_OFF</td>
<td>For each entry in <code>CMaket_OFF</code>, a disabled boolean value is added to <code>CMaket_ARGS</code>. See <code>CMaket_ON</code> and <code>CMaket_OFF</code>.</td>
</tr>
<tr>
<td>CMaket_BUILD_TYPE</td>
<td>Type of build (CMake predefined build profiles). Default is <code>Release</code>, or <code>Debug</code> if <code>WITH_DEBUG</code> is set.</td>
</tr>
</tbody>
</table>
| CMaket_SOURCE_PATH     | Path to the source directory. Default is `$(WRKSRC)`.

124
<table>
<thead>
<tr>
<th>Variable</th>
<th>Means</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIGURE_ENV</td>
<td>Additional environment variables to be set for the cmake binary.</td>
</tr>
</tbody>
</table>

表 11. Variables the Users Can Define for cmake Builds

<table>
<thead>
<tr>
<th>Variable</th>
<th>Means</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMAKE_NOCOLOR</td>
<td>Disables color build output. Default not set, unless BATCH or PACKAGE_BUILDING are set.</td>
</tr>
</tbody>
</table>

CMake supports these build profiles: Debug, Release, RelWithDebInfo and MinSizeRel. Debug and Release profiles respect system *FLAGS, RelWithDebInfo and MinSizeRel will set CFLAGS to -O2 -g and -Os -DNDEBUG correspondingly. The lower-cased value of CMAKE_BUILD_TYPE is exported to PLIST_SUB and must be used if the port installs *.cmake depending on the build type (see devel/kf5-kcrash for an example). Please note that some projects may define their own build profiles and/or force particular build type by setting CMAKE_BUILD_TYPE in CMakeLists.txt. To make a port for such a project respect CFLAGS and WITH_DEBUG, the CMAKE_BUILD_TYPE definitions must be removed from those files.

Most CMake-based projects support an out-of-source method of building. The out-of-source build for a port is the default setting. An in-source build can be requested by using the :insource suffix. With out-of-source builds, CONFIGURE_WRKSRC, BUILD_WRKSRC and INSTALL_WRKSRC will be set to ${WRKDIR}/.build and this directory will be used to keep all files generated during configuration and build stages, leaving the source directory intact.

例 54. USES= cmake Example

This snippet demonstrates the use of CMake for a port. CMAKE_SOURCE_PATH is not usually required, but can be set when the sources are not located in the top directory, or if only a subset of the project is intended to be built by the port.

```
USES= cmake
CMAKE_SOURCE_PATH= ${WRKSRC}/subproject
```
55. **CMAKE_ON** and **CMAKE_OFF**

When adding boolean values to **CMAKE_ARGS**, it is easier to use the **CMAKE_ON** and **CMAKE_OFF** variables instead. This:

```plaintext
CMAKE_ON= VAR1 VAR2
CMAKE_OFF= VAR3
```

Is equivalent to:

```plaintext
CMAKE_ARGS= -DVAR1:BOOL=TRUE -DVAR2:BOOL=TRUE -DVAR3:BOOL=FALSE
```

This is only for the default values off **CMAKE_ARGS**. The helpers described in **OPT_CMAKE_BOOL** and **OPT_CMAKE_BOOL_OFF** use the same semantics, but for optional values.

### 6.5.5. Using scons

If the port uses SCons, define **USES=scons**.

To make third party **SConstruct** respect everything that is passed to SCons in the environment (that is, most importantly, **CC/CXX/CFLAGS/CXXFLAGS**), patch **SConstruct** so build **Environment** is constructed like this:

```python
env = Environment(**ARGUMENTS)
```

It may be then modified with **env.Append** and **env.Replace**.

### 6.5.6. Building Rust Applications with cargo

For ports that use Cargo, define **USES=cargo**.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CARGO_CRATES</strong></td>
<td></td>
<td>List of crates the port depends on. Each entry needs to have a format like <strong>cratename-semver</strong> for example, <strong>libc-0.2.40</strong>. Port maintainers can generate this list from Cargo.lock using <strong>make cargo-crates</strong>. Manually bumping crate versions is possible but be mindful of transitive dependencies.</td>
</tr>
<tr>
<td>Variable</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CARGO_FEATURES</td>
<td></td>
<td>List of application features to build (space separated list). To deactivate all default features add the special token --no-default-features to CARGO_FEATURES. Manually passing it to CARGO_BUILD_ARGS, CARGO_INSTALL_ARGS, and CARGO_TEST_ARGS is not needed.</td>
</tr>
<tr>
<td>CARGO_CARGOTOML</td>
<td>${WRKSRC}/Cargo.toml</td>
<td>The path to the Cargo.toml to use.</td>
</tr>
<tr>
<td>CARGO_CARGOLOCK</td>
<td>${WRKSRC}/Cargo.lock</td>
<td>The path to the Cargo.lock to use for make cargo-crates. It is possible to specify more than one lock file when necessary.</td>
</tr>
<tr>
<td>CARGO_ENV</td>
<td></td>
<td>A list of environment variables to pass to Cargo similar to MAKE_ENV.</td>
</tr>
<tr>
<td>RUSTFLAGS</td>
<td></td>
<td>Flags to pass to the Rust compiler.</td>
</tr>
<tr>
<td>CARGO_CONFIGURE</td>
<td>yes</td>
<td>Use the default do-configure.</td>
</tr>
<tr>
<td>CARGO_UPDATE_ARGS</td>
<td></td>
<td>Extra arguments to pass to Cargo during the configure phase. Valid arguments can be looked up with cargo update --help.</td>
</tr>
<tr>
<td>CARGO_BUILDDEP</td>
<td>yes</td>
<td>Add a build dependency on lang/rust.</td>
</tr>
<tr>
<td>CARGO_CARGO_BIN</td>
<td>${LOCALBASE}/bin/cargo</td>
<td>Location of the cargo binary.</td>
</tr>
<tr>
<td>CARGO_BUILD</td>
<td>yes</td>
<td>Use the default do-build.</td>
</tr>
<tr>
<td>CARGO_BUILD_ARGS</td>
<td></td>
<td>Extra arguments to pass to Cargo during the build phase. Valid arguments can be looked up with cargo build --help.</td>
</tr>
<tr>
<td>CARGO_INSTALL</td>
<td>yes</td>
<td>Use the default do-install.</td>
</tr>
<tr>
<td>CARGO_INSTALL_ARGS</td>
<td></td>
<td>Extra arguments to pass to Cargo during the install phase. Valid arguments can be looked up with cargo install --help.</td>
</tr>
<tr>
<td>Variable</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CARGO_INSTALL_PATH</td>
<td>.</td>
<td>Path to the crate to install. This is passed to cargo install via its --path argument. When multiple paths are specified cargo install is run multiple times.</td>
</tr>
<tr>
<td>CARGO_TEST</td>
<td>yes</td>
<td>Use the default do-test.</td>
</tr>
<tr>
<td>CARGO_TEST_ARGS</td>
<td></td>
<td>Extra arguments to pass to Cargo during the test phase. Valid arguments can be looked up with cargo test --help.</td>
</tr>
<tr>
<td>CARGO_TARGET_DIR</td>
<td>${WRKDIR}/target</td>
<td>Location of the cargo output directory.</td>
</tr>
<tr>
<td>CARGO_DIST_SUBDIR</td>
<td>rust/crates</td>
<td>Directory relative to DISTDIR where the crate distribution files will be stored.</td>
</tr>
<tr>
<td>CARGO_VENDOR_DIR</td>
<td>${WRKSRC}/cargo-crates</td>
<td>Location of the vendor directory where all crates will be extracted to. Try to keep this under PATCH_WRKSRC, so that patches can be applied easily.</td>
</tr>
<tr>
<td>CARGO_USE_GITHUB</td>
<td>no</td>
<td>Enable fetching of crates locked to specific Git commits on GitHub via GH_TUPLE. This will try to patch all Cargo.toml under WRKDIR to point to the offline sources instead of fetching them from a Git repository during the build.</td>
</tr>
<tr>
<td>CARGO_USE_GITLAB</td>
<td>no</td>
<td>Same as CARGO_USE_GITHUB but for GitLab instances and GL_TUPLE.</td>
</tr>
</tbody>
</table>
Creating a Cargo based port is a three stage process. First we need to provide a ports template that fetches the application distribution file:

```plaintext
PORTNAME= tokei
DISTVERSIONPREFIX= v
DISTVERSION= 7.0.2
CATEGORIES= devel

MAINTAINER= tobik@FreeBSD.org
COMMENT= Display statistics about your code

USES= cargo
USE_GITHUB= yes
GH_ACCOUNT= Aaronepower

.include <bsd.port.mk>
```

Generate an initial distinfo:

```plaintext
% make makesum
=> Aaronepower-tokei-v7.0.2_GH0.tar.gz doesn't seem to exist in /usr/ports/distfiles/.
=> Attempting to fetch https://codeload.github.com/Aaronepower/tokei/tar.gz/v7.0.2?dummy=/Aaronepower-tokei-v7.0.2_GH0.tar.gz
fetch: https://codeload.github.com/Aaronepower/tokei/tar.gz/v7.0.2?dummy=/Aaronepower-tokei-v7.0.2_GH0.tar.gz: size of remote file is not known
Aaronepower-tokei-v7.0.2_GH0.tar.gz                     45 kB  239 kBps 00m00s
```

Now the distribution file is ready to use and we can go ahead and extract crate dependencies from the bundled Cargo.lock:

```plaintext
% make cargo-crates
CARGO_CRATES= aho-corasick-0.6.4 \
   ansi_term-0.11.0 \
   arrayvec-0.4.7 \
   atty-0.2.9 \
   bitflags-1.0.1 \
   byteorder-1.2.2 \
   [...]
```

The output of this command needs to be pasted directly into the Makefile:
PORTNAME=   tokei
DISTVERSIONPREFIX=  v
DISTVERSION=    7.0.2
CATEGORIES=  devel

MAINTAINER= tobik@FreeBSD.org
COMMENT= Display statistics about your code

USES=       cargo
USE_GITHUB= yes
GH_ACCOUNT= Aaronepower

CARGO_CRATES=   aho-corasick-0.6.4  \
                 ansi_term-0.11.0  \
                 arrayvec-0.4.7  \
                 atty-0.2.9  \
                 bitflags-1.0.1  \
                 byteorder-1.2.2  \
                 [...]

.include <bsd.port.mk>
% make makesum

=> rust/crates/aho-corasick-0.6.4.tar.gz doesn't seem to exist in /usr/ports/distfiles/.
=> Attempting to fetch https://crates.io/api/v1/crates/aho-corasick/0.6.4/download?dummy=/rust/crates/aho-corasick-0.6.4.tar.gz

rust/crates/aho-corasick-0.6.4.tar.gz         100% of   24 kB  6139 kBps 00m00s

=> rust/crates/ansi_term-0.11.0.tar.gz doesn't seem to exist in /usr/ports/distfiles/.
=> Attempting to fetch https://crates.io/api/v1/crates/ansi_term/0.11.0/download?dummy=/rust/crates/ansi_term-0.11.0.tar.gz

rust/crates/ansi_term-0.11.0.tar.gz         100% of   16 kB  21 MBps 00m00s

=> rust/crates/arrayvec-0.4.7.tar.gz doesn't seem to exist in /usr/ports/distfiles/.
=> Attempting to fetch https://crates.io/api/v1/crates/arrayvec/0.4.7/download?dummy=/rust/crates/arrayvec-0.4.7.tar.gz

rust/crates/arrayvec-0.4.7.tar.gz         100% of   22 kB  3237 kBps 00m00s

=> rust/crates/atty-0.2.9.tar.gz doesn't seem to exist in /usr/ports/distfiles/.
=> Attempting to fetch https://crates.io/api/v1/crates/atty/0.2.9/download?dummy=/rust/crates/atty-0.2.9.tar.gz

rust/crates/atty-0.2.9.tar.gz         100% of   5898 B   81 MBps 00m00s

=> rust/crates/bitflags-1.0.1.tar.gz doesn't seem to exist in /usr/ports/distfiles/.

[...]

The port is now ready for a test build and further adjustments like creating a plist, writing a description, adding license information, options, etc. as normal.

If you are not testing your port in a clean environment like with Poudriere, remember to run `make clean` before any testing.

例 57. Enabling Additional Application Features

Some applications define additional features in their Cargo.toml. They can be compiled in by setting `CARGO_FEATURES` in the port.

Here we enable Tokei's json and yaml features:

```
CARGO_FEATURES= json yaml
```
An example `[features]` section in Cargo.toml could look like this:

```
[features]
pulseaudio_backend = ["librespot-playback/pulseaudio-backend"]
portaudio_backend = ["librespot-playback/portaudio-backend"]
default = ["pulseaudio_backend"]
```

`pulseaudio_backend` is a default feature. It is always enabled unless we explicitly turn off default features by adding `--no-default-features` to CARGO_FEATURES. Here we turn the `portaudio_backend` and `pulseaudio_backend` features into port options:

```
CARGO_FEATURES=--no-default-features
OPTIONS_DEFINE= PORTAUDIO PULSEAUDIO
PORTAUDIO_VARS= CARGO_FEATURES+=portaudio_backend
PULSEAUDIO_VARS= CARGO_FEATURES+=pulseaudio_backend
```

Crates have their own licenses. It is important to know what they are when adding a `LICENSE` block to the port (see Licenses). The helper target `cargo-crates-licenses` will try to list all the licenses of all crates defined in CARGO_CRATES.

```
% make cargo-crates-licenses
aho-corasick-0.6.4  Unlicense/MIT
ansi_term-0.11.0    MIT
arrayvec-0.4.7      MIT/Apache-2.0
atty-0.2.9          MIT
byteorder-1.0.1     MIT/Apache-2.0
 [...]
```

The license names `make cargo-crates-licenses` outputs are SPDX 2.1 licenses expression which do not match the license names defined in the ports framework. They need to be translated to the names from Predefined License List.

### 6.5.7. Using meson

For ports that use Meson, define `USES=meson`.

---

132
表 13. Variables for Ports That Use meson

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MESON_ARGS</td>
<td>Port specific Meson flags to be passed to the meson binary.</td>
</tr>
<tr>
<td>MESON_BUILD_DIR</td>
<td>Path to the build directory relative to WRKSRW. Default is _build.</td>
</tr>
</tbody>
</table>

例 60. USES=meson Example

This snippet demonstrates the use of Meson for a port.

```
USES= meson
MESON_ARGS= -Dfoo=enabled
```

6.5.8. Building Go Applications

For ports that use Go, define USES=go. Refer to go for a list of variables that can be set to control the build process.
In most cases, it is sufficient to set the `GO_MODULE` variable to the value specified by the `module` directive in `go.mod`:

```
PORTNAME=  hey
PORTVERSION= 0.1.4
DISTVERSIONPREFIX= v
CATEGORIES=  benchmarks

MAINTAINER=  dmgk@FreeBSD.org
COMMENT=  Tiny program that sends some load to a web application

LICENSE=  APACHE20
LICENSE_FILE=  ${WRKSRC}/LICENSE

USES=  go:modules
GO_MODULE=  github.com/rakyll/hey

PLIST_FILES=  bin/hey

.include <bsd.port.mk>
```

If the "easy" way is not adequate or more control over dependencies is needed, the full porting process is described below.

Creating a Go based port is a five stage process. First we need to provide a ports template that fetches the application distribution file:

```
PORTNAME=  ghq
DISTVERSIONPREFIX=  v
DISTVERSION=  0.12.5
CATEGORIES=  devel

MAINTAINER=  tobik@FreeBSD.org
COMMENT=  Remote repository management made easy

USES=  go:modules
USE_GITHUB=  yes
GH_ACCOUNT=  motemen

.include <bsd.port.mk>
```

Generate an initial distinfo:
% make makesum

License MIT accepted by the user

motemen-ghq-v0.12.5_GH0.tar.gz doesn't seem to exist in /usr/ports/distfiles/.

Attempting to fetch

https://codeload.github.com/motemen/ghq/tar.gz/v0.12.5?dummy=/motemen-ghq-v0.12.5_GH0.tar.gz

cannot fetch: https://codeload.github.com/motemen/ghq/tar.gz/v0.12.5?dummy=/motemen-ghq-v0.12.5_GH0.tar.gz: size of remote file is not known

Now the distribution file is ready to use and we can extract the required Go module dependencies. This step requires having ports-mgmt/modules2tuple installed:

% make gomod-vendor

 GH_TUPLE=  

Songmu:gitconfig:v0.0.2:songmu_gitconfig/vendor/github.com/Songmu/gitconfig

daviddengcn:go-colortext:186a3d44e920:daviddengcn_go_colortext/vendor/github.com/daviddengcn/go-colortext

go-yaml:yaml:v2.2.2:go_yaml_yaml/vendor/gopkg.in/yaml.v2

golang:net:3ec191127204:golang_net/vendor/golang.org/x/net

golang:sync:112230192c58:golang_sync/vendor/golang.org/x/sync

golang:xerrors:3ee3066db522:golang_xerrors/vendor/golang.org/x/xerrors

motemen:go-colorine:45d19169413a:motemen_go_colorine/vendor/github.com/motemen/go-colorine

urfave:cli:v1.20.0:urfave_cli/vendor/github.com/urfave/cli

The output of this command needs to be pasted directly into the Makefile:
PORTNAME=   ghq
DISTVERSIONPREFIX=  v
DISTVERSION=    0.12.5
CATEGORIES=  devel

MAINTAINER= tobik@FreeBSD.org
COMMENT=    Remote repository management made easy

USES=       go:modules
USE_GITHUB= yes
GH_ACCOUNT= motemen
GH_TUPLE=

Songmu:gitconfig:v0.0.2:songmu_gitconfig/vendor/github.com/Songmu/gitconfig \
daviddengcn:go-
colortext:186a3d44e920:daviddengcn_go_colortext/vendor/github.com/daviddengcn/go-
colortext \
    go-yaml:yaml:v2.2.2:go_yaml_vendor/gopkg.in/yaml.v2 \
golang:net:3ec191127204:golang_net/vendor/golang.org/x/net \
golang:sync:112230192c58:golang_sync/vendor/golang.org/x/sync \
golang:xerrors:3ee3066db522:golang_xerrors/vendor/golang.org/x/xerrors \
motemen:go-
colorine:45d19169413a:motemen_go_colorine/vendor/github.com/motemen/go-colorine \
urfave:cli:v1.20.0:urfave_cli/vendor/github.com/urfave/cli

.include <bsd.port.mk>

distinfo needs to be regenerated to contain all the distribution files:

% make makesum
=> Songmu-gitconfig-v0.0.2_GH0.tar.gz doesn't seem to exist in /usr/ports/distfiles/.
=> Attempting to fetch
https://codeload.github.com/Songmu/gitconfig/tar.gz/v0.0.2?dummy=1/Songmu-gitconfig-v0.0.2_GH0.tar.gz
fetch: https://codeload.github.com/Songmu/gitconfig/tar.gz/v0.0.2?dummy=1/Songmu-gitconfig-v0.0.2_GH0.tar.gz: size of remote file is not known
Songmu-gitconfig-v0.0.2_GH0.tar.gz             5662 B  936 kBps    00s
=> daviddengcn-go-colortext-186a3d44e920_GH0.tar.gz doesn't seem to exist in /usr/ports/distfiles/.
=> Attempting to fetch https://codeload.github.com/daviddengcn/go-
colortext/tar.gz/186a3d44e920?dummy=1/daviddengcn-go-colortext-186a3d44e920_GH0.tar.gz
fetch: https://codeload.github.com/daviddengcn/go-
colortext/tar.gz/186a3d44e920?dummy=1/daviddengcn-go-colortext-186a3d44e920_GH0.tar.gz: size of remote file is not known
daviddengcn-go-colortext-186a3d44e920_GH0.tar.gz      4534 B 1098 kBps    00s
[...]
The port is now ready for a test build and further adjustments like creating a plist, writing a
description, adding license information, options, etc. as normal.

If you are not testing your port in a clean environment like with Poudriere, remember to run
make clean before any testing.

Example 62. Setting Output Binary Name or Installation Path

Some ports need to install the resulting binary under a different name or to a path other than
the default ${PREFIX}/bin. This can be done by using GO_TARGET tuple syntax, for example:

```
GO_TARGET= ./cmd/ipfs:ipfs-go
```

will install ipfs binary as ${PREFIX}/bin/ipfs-go and

```
GO_TARGET= ./dnscrypt-proxy:${PREFIX}/sbin/dnscrypt-proxy
```

will install dnscrypt-proxy to ${PREFIX}/sbin.

6.5.9. Building Haskell Applications with cabal

For ports that use Cabal, build system defines USES=cabal. Refer to cabal for a list of variables that
can be set to control the build process.
When preparing a Haskell Cabal port, the `devel/hs-cabal-install` program is required, so make sure it is installed beforehand. First we need to define common ports variables that allows cabal-install to fetch the package distribution file:

```
PORTNAME=   ShellCheck
DISTVERSION=    0.6.0
CATEGORIES=  devel

MAINTAINER=  haskell@FreeBSD.org
COMMENT=    Shell script analysis tool
USES=       cabal
```

This minimal Makefile allows us to fetch the distribution file:

```
% make cabal-extract
 [...]  
  Downloading the latest package list from hackage.haskell.org
  cabal get ShellCheck-0.6.0
  Downloading ShellCheck-0.6.0
  Downloaded ShellCheck-0.6.0
  Unpacking to ShellCheck-0.6.0/
```

Now we have `ShellCheck.cabal` package description file, which allows us to fetch all package’s dependencies, including transitive ones:

```
% make cabal-extract-deps
 [...]  
  Resolving dependencies...
  Downloading  base-orphans-0.8.2
  Downloaded  base-orphans-0.8.2
  Downloading  primitive-0.7.0.0
  Starting  base-orphans-0.8.2 (lib)
  Building  base-orphans-0.8.2 (lib)
  Downloaded  primitive-0.7.0.0
  Downloading  dlist-0.8.0.7
  [...]  
```

As a side effect, the package's dependencies are also compiled, so the command may take some time. Once done, a list of required dependencies can generated:
Haskell packages may contain revisions, just like FreeBSD ports. Revisions can affect only .cabal files, but it is still important to pull them in. To check USE_CABAL items for available revision updates, run following command:

% make make-use-cabal
USE_CABAL=QuickCheck-2.12.6.1 \ 
hashable-1.3.0.0 \ 
integer-logarithms-1.0.3 \ 
[...]

Note additional version numbers after _ symbol. Put newly generated USE_CABAL list instead of an old one.

Finally, distinfo needs to be regenerated to contain all the distribution files:

% make makesum
=> ShellCheck-0.6.0.tar.gz doesn't seem to exist in /usr/local/poudriere/ports/git/distfiles/cabal.
=> Attempting to fetch https://hackage.haskell.org/package/ShellCheck-0.6.0/ShellCheck-0.6.0.tar.gz
ShellCheck-0.6.0.tar.gz 136 kB  642 kBps  00s
QuickCheck-2.12.6.1/QuickCheck-2.12.6.1.tar.gz 65 kB  361 kBps  00s
[...]

The port is now ready for a test build and further adjustments like creating a plist, writing a description, adding license information, options, etc. as normal.

If you are not testing your port in a clean environment like with Poudriere, remember to run make clean before any testing.

### 6.6. Using GNU Autotools

If a port needs any of the GNU Autotools software, add USES=autoreconf. See autoreconf for more information.
6.7. Using GNU gettext

6.7.1. Basic Usage

If the port requires gettext, set \texttt{USES= gettext}, and the port will inherit a dependency on \texttt{libintl.so} from \texttt{devel/gettext}. Other values for \texttt{gettext} usage are listed in \texttt{USES=gettext}.

A rather common case is a port using \texttt{gettext} and \texttt{configure}. Generally, GNU \texttt{configure} should be able to locate \texttt{gettext} automatically.

\begin{verbatim}
USES= gettext
GNU_CONFIGURE= yes
\end{verbatim}

If it ever fails to, hints at the location of \texttt{gettext} can be passed in \texttt{CPPFLAGS} and \texttt{LDFLAGS} using \texttt{localbase} as follows:

\begin{verbatim}
USES= gettext localbase:ldflags
GNU_CONFIGURE= yes
\end{verbatim}

6.7.2. Optional Usage

Some software products allow for disabling NLS. For example, through passing \texttt{--disable-nls} to \texttt{configure}. In that case, the port must use \texttt{gettext} conditionally, depending on the status of the NLS option. For ports of low to medium complexity, use this idiom:

\begin{verbatim}
GNU_CONFIGURE= yes
OPTIONS_DEFINE= NLS
OPTIONS_SUB= yes
NLS_USES= gettext
NLS_CONFIGURE_ENABLE= nls
.include <bsd.port.mk>
\end{verbatim}

Or using the older way of using options:
The next item on the to-do list is to arrange so that the message catalog files are included in the packing list conditionally. The Makefile part of this task is already provided by the idiom. It is explained in the section on advanced pkg-plist practices. In a nutshell, each occurrence of `%%NLS%%` in pkg-plist will be replaced by `"@comment "` if NLS is disabled, or by a null string if NLS is enabled. Consequently, the lines prefixed by `%%NLS%%` will become mere comments in the final packing list if NLS is off; otherwise the prefix will be just left out. Then insert `%%NLS%%` before each path to a message catalog file in pkg-plist. For example:

```plaintext
%%NLS%%share/locale/fr/LC_MESSAGES/foobar.mo
%%NLS%%share/locale/no/LC_MESSAGES/foobar.mo
```

In high complexity cases, more advanced techniques may be needed, such as dynamic packing list generation.

## 6.7.3. Handling Message Catalog Directories

There is a point to note about installing message catalog files. The target directories for them, which reside under LOCALBASE/share/locale, must not be created and removed by a port. The most popular languages have their respective directories listed in PORTSDIR/Templates/BSD.local.dist. The directories for many other languages are governed by the `devel/gettext` port. Consult its pkg-plist and see whether the port is going to install a message catalog file for a unique language.

## 6.8. Using Perl

If `MASTER_SITES` is set to CPAN, the correct subdirectory is usually selected automatically. If the default subdirectory is wrong, CPAN/Module can be used to change it. `MASTER_SITES` can also be set to the old `MASTER_SITE_PERL_CPAN`, then the preferred value of `MASTER_SITE_SUBDIR` is the top-level hierarchy name. For example, the recommended value for `p5-Module-Name` is `Module`. The top-level hierarchy can be examined at cpan.org. This keeps the port working when the author of the module changes.

The exception to this rule is when the relevant directory does not exist or the distfile does not exist.
in that directory. In such case, using author's id as MASTER_SITE_SUBDIR is allowed. The CPAN:AUTHOR macro can be used, which will be translated to the hashed author directory. For example, CPAN:AUTHOR will be converted to authors/id/A/AU/AUTHOR.

When a port needs Perl support, it must set USES=per15 with the optional USE_PERL5 described in the perl5 USES description.

表 14. Read-Only Variables for Ports That Use Perl

<table>
<thead>
<tr>
<th>Read only variables</th>
<th>Means</th>
</tr>
</thead>
<tbody>
<tr>
<td>PERL</td>
<td>The full path of the Perl 5 interpreter, either in the system or installed from a port, but without the version number. Use this when the software needs the path to the Perl interpreter. To replace &quot;#!&quot; lines in scripts, use shebangfix.</td>
</tr>
<tr>
<td>PERL_VERSION</td>
<td>The full version of Perl installed (for example, 5.8.9).</td>
</tr>
<tr>
<td>PERL_LEVEL</td>
<td>The installed Perl version as an integer of the form MNNNP (for example, 500809).</td>
</tr>
<tr>
<td>PERL_ARCH</td>
<td>Where Perl stores architecture dependent libraries. Defaults to ${ARCH}-freebsd.</td>
</tr>
<tr>
<td>PERL_PORT</td>
<td>Name of the Perl port that is installed (for example, per15).</td>
</tr>
<tr>
<td>SITE_PERL</td>
<td>Directory name where site specific Perl packages go. This value is added to PLIST_SUB.</td>
</tr>
</tbody>
</table>

> Ports of Perl modules which do not have an official website must link to cpan.org in the WWW line of pkg-descr. The preferred URL form is http://search.cpan.org/dist/Module-Name/ (including the trailing slash).

> Do not use ${SITE_PERL} in dependency declarations. Doing so assumes that perl5.mk has been included, which is not always true. Ports depending on this port will have incorrect dependencies if this port's files move later in an upgrade. The right way to declare Perl module dependencies is shown in the example below.

例 64. Perl Dependency Example

```
p5-I0-Tee>=0.64:devel/p5-I0-Tee
```

For Perl ports that install manual pages, the macro PERL5_MAN3 and PERL5_MAN1 can be used inside pkg-plist. For example,
can be replaced with

%%PERL5_MAN1%%/event.1.gz
%%PERL5_MAN3%%/AnyEvent::I3.3.gz

There are no PERL5_MAN_x_ macros for the other sections (x in 2 and 4 to 9) because those get installed in the regular directories.

例 65. A Port Which Only Requires Perl to Build

As the default USE_PERL5 value is build and run, set it to:

```
USES= perl5
USE_PERL5= build
```

例 66. A Port Which Also Requires Perl to Patch

From time to time, using sed(1) for patching is not enough. When using perl(1) is easier, use:

```
USES= perl5
USE_PERL5= patch build run
```

例 67. A Perl Module Which Needs ExtUtils::MakeMaker to Build

Most Perl modules come with a Makefile.PL configure script. In this case, set:

```
USES= perl5
USE_PERL5= configure
```
When a Perl module comes with a Build.PL configure script, it can require Module::Build, in which case, set

```
USES=   perl5
USE_PERL5= modbuild
```

If it instead requires Module::Build::Tiny, set

```
USES=   perl5
USE_PERL5= modbuildtiny
```

### 6.9. Using X11

#### 6.9.1. X.Org Components

The X11 implementation available in The Ports Collection is X.Org. If the application depends on X components, add `USES= xorg` and set `USE_XORG` to the list of required components. A full list can be found in `xorg`.

The Mesa Project is an effort to provide free OpenGL implementation. To specify a dependency on various components of this project, use `USES= gl` and `USE_GL`. See `gl` for a full list of available components. For backwards compatibility, the value of `yes` maps to `glu`.

**Example 69. USE_XORG Example**

```
USES=   gl xorg
USE_GL=  glu
USE_XORG= xrender xft xkbfile xt xaw
```

<table>
<thead>
<tr>
<th>USES=</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>imake</code></td>
<td>The port uses <code>imake</code>.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>XMKF</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set to the path of <code>xmkmf</code> if not in the PATH. Defaults to <code>xmkmf -a</code>.</td>
<td></td>
</tr>
</tbody>
</table>

**Example 70. Using X11-Related Variables**

```
# Use some X11 libraries
USES=   xorg
USE_XORG= x11 xpm
```
6.9.2. Ports That Require Motif

If the port requires a Motif library, define \texttt{USES= motif} in the Makefile. Default Motif implementation is \texttt{x11-toolkits/open-motif}. Users can choose \texttt{x11-toolkits/lesstif} instead by setting \texttt{WANT_LESSTIF} in their make.conf.

\texttt{MOTIFLIB} will be set by \texttt{motif.mk} to reference the appropriate Motif library. Please patch the source of the port to use \texttt{$\{MOTIFLIB\}} wherever the Motif library is referenced in the original Makefile or Imakefile.

There are two common cases:

- If the port refers to the Motif library as \texttt{-lXm} in its Makefile or Imakefile, substitute \texttt{$\{MOTIFLIB\}} for it.
- If the port uses \texttt{XmClientLibs} in its Imakefile, change it to \texttt{$\{MOTIFLIB\} $\{XTOOLLIB\} $\{XLIB\}}.

Note that \texttt{MOTIFLIB} (usually) expands to \texttt{-L/usr/local/lib -lXm -lXp} or \texttt{/usr/local/lib/libXm.a}, so there is no need to add \texttt{-L} or \texttt{-l} in front.

6.9.3. X11 Fonts

If the port installs fonts for the X Window System, put them in \texttt{LOCALBASE/lib/X11/fonts/local}.

6.9.4. Getting a Fake \texttt{DISPLAY} with Xvfb

Some applications require a working X11 display for compilation to succeed. This poses a problem for machines that operate headless. When this variable is used, the build infrastructure will start the virtual framebuffer X server. The working \texttt{DISPLAY} is then passed to the build. See \texttt{USES=display} for the possible arguments.

\begin{verbatim}
USES=   display
\end{verbatim}

6.9.5. Desktop Entries

Desktop entries (a Freedesktop standard) provide a way to automatically adjust desktop features when a new program is installed, without requiring user intervention. For example, newly-installed programs automatically appear in the application menus of compatible desktop environments. Desktop entries originated in the GNOME desktop environment, but are now a standard and also work with KDE and Xfce. This bit of automation provides a real benefit to the user, and desktop entries are encouraged for applications which can be used in a desktop environment.

6.9.5.1. Using Predefined \texttt{.desktop} Files

Ports that include predefined \texttt{*.desktop} must include those files in pkg-plist and install them in the \texttt{$\{LOCALBASE\}/share/applications} directory. The \texttt{INSTALL_DATA} macro is useful for installing these files.
6.9.5.2. Updating Desktop Database

If a port has a MimeType entry in its portname.desktop, the desktop database must be updated after install and deinstall. To do this, define `USES= desktop-file-utils`.

6.9.5.3. Creating Desktop Entries with `DESKTOP_ENTRIES`

Desktop entries can be easily created for applications by using `DESKTOP_ENTRIES`. A file named name.desktop will be created, installed, and added to pkg-plist automatically. Syntax is:

```
DESKTOP_ENTRIES= "NAME" "COMMENT" "ICON" "COMMAND" "CATEGORY" StartupNotify
```

The list of possible categories is available on the Freedesktop website. `StartupNotify` indicates whether the application is compatible with startup notifications. These are typically a graphic indicator like a clock that appear at the mouse pointer, menu, or panel to give the user an indication when a program is starting. A program that is compatible with startup notifications clears the indicator after it has started. Programs that are not compatible with startup notifications would never clear the indicator (potentially confusing and infuriating the user), and must have `StartupNotify` set to `false` so the indicator is not shown at all.

Example:

```
DESKTOP_ENTRIES= "ToME" "Roguelike game based on JRR Tolkien's work" \\
"${DATADIR}/xtra/graf/tome-128.png" \\
"tome -v -g" "Application;Game;RolePlaying;" \\
false
```

6.10. Using GNOME

6.10.1. Introduction

This chapter explains the GNOME framework as used by ports. The framework can be loosely divided into the base components, GNOME desktop components, and a few special macros that simplify the work of port maintainers.

6.10.2. Using `USE_GNOME`

Adding this variable to the port allows the use of the macros and components defined in bsd.gnome.mk. The code in bsd.gnome.mk adds the needed build-time, run-time or library dependencies or the handling of special files. GNOME applications under FreeBSD use the `USE_GNOME` infrastructure. Include all the needed components as a space-separated list. The `USE_GNOME` components are divided into these virtual lists: basic components, GNOME 3 components and legacy components. If the port needs only GTK3 libraries, this is the shortest way to define it:

```
USE_GNOME= gtk30
```
USE_GNOME components automatically add the dependencies they need. Please see GNOME Components for an exhaustive list of all USE_GNOME components and which other components they imply and their dependencies.

Here is an example Makefile for a GNOME port that uses many of the techniques outlined in this document. Please use it as a guide for creating new ports.

```bash
# $FreeBSD$
PORTNAME=   regexxer
DISTVERSION=    0.10
CATEGORIES= devel textproc gnome
MASTER_SITES=   GNOME

MAINTAINER= kwm@FreeBSD.org
COMMENT=    Interactive tool for performing search and replace operations

USES=       gettext gmake localbase:ldflags pathfix pkgconfig tar:xz
GNU_CONFIGURE=  yes
USE_GNOME=  gnomeprefix intlhack gtksourceviewmm3

GLIB_SCHEMAS=   org.regexxer.gschematic.xml

.include <bsd.port.mk>
```

The USE_GNOME macro without any arguments does not add any dependencies to the port. USE_GNOME cannot be set after bsd.port.pre.mk.

### 6.10.3. Variables

This section explains which macros are available and how they are used. Like they are used in the above example. The GNOME Components has a more in-depth explanation. USE_GNOME has to be set for these macros to be of use.

**GLIB_SCHEMAS**

List of all the glib schema files the port installs. The macro will add the files to the port plist and handle the registration of these files on install and deinstall.

The glib schema files are written in XML and end with the gschematic.xml extension. They are installed in the share/glib-2.0/schemas/ directory. These schema files contain all application config values with their default settings. The actual database used by the applications is built by glib-compile-schema, which is run by the GLIB_SCHEMAS macro.

```bash
GLIB_SCHEMAS=foo.gschematic.xml
```

Do not add glib schemas to the pkg-plist. If they are listed in pkg-plist, they will not be registered and the applications might not work properly.
GCONF_SCHEMAS

List all the gconf schema files. The macro will add the schema files to the port plist and will handle their registration on install and deinstall.

GConf is the XML-based database that virtually all GNOME applications use for storing their settings. These files are installed into the etc/gconf/schemas directory. This database is defined by installed schema files that are used to generate %gconf.xml key files. For each schema file installed by the port, there must be an entry in the Makefile:

```
GCONF_SCHEMAS=my_app.schemas my_app2.schemas my_app3.schemas
```

Gconf schemas are listed in the GCONF_SCHEMAS macro rather than pkg-plist. If they are listed in pkg-plist, they will not be registered and the applications might not work properly.

INSTALLS_OMF

Open Source Metadata Framework (OMF) files are commonly used by GNOME 2 applications. These files contain the application help file information, and require special processing by ScrollKeeper/riarian. To properly register OMF files when installing GNOME applications from packages, make sure that omf files are listed in pkg-plist and that the port Makefile has INSTALLS_OMF defined:

```
INSTALLS_OMF=yes
```

When set, bsd.gnome.mk automatically scans pkg-plist and adds appropriate @exec and @unexec directives for each .omf to track in the OMF registration database.

6.11. GNOME Components

For further help with a GNOME port, look at some of the existing ports for examples. The FreeBSD GNOME page has contact information if more help is needed. The components are divided into GNOME components that are currently in use and legacy components. If the component supports argument, they are listed between parenthesis in the description. The first is the default. "Both" is shown if the component defaults to adding to both build and run dependencies.

### Table 16. GNOME Components

<table>
<thead>
<tr>
<th>Component</th>
<th>Associated program</th>

表 19. Deprecated Components: Do Not Use

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pangox-compat</td>
<td>pangox-compat has been deprecated and split off from the pango package.</td>
</tr>
</tbody>
</table>
6.12. Using Qt

For ports that are part of Qt itself, see `qt-dist`.

6.12.1. Ports That Require Qt

The Ports Collection provides support for Qt 5 with `USES+=qt:5`. Set `USE_QT` to the list of required Qt components (libraries, tools, plugins).

The Qt framework exports a number of variables which can be used by ports, some of them listed below:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QMAKE</td>
<td>Full path to <code>qmake</code> binary.</td>
</tr>
<tr>
<td>LRELEASE</td>
<td>Full path to <code>lrelease</code> utility.</td>
</tr>
<tr>
<td>MOC</td>
<td>Full path to <code>moc</code>.</td>
</tr>
<tr>
<td>RCC</td>
<td>Full path to <code>rcc</code>.</td>
</tr>
<tr>
<td>UIC</td>
<td>Full path to <code>uic</code>.</td>
</tr>
<tr>
<td>QT_INCDIR</td>
<td>Qt include directory.</td>
</tr>
<tr>
<td>QT_LIBDIR</td>
<td>Qt libraries path.</td>
</tr>
<tr>
<td>QT_PLUGINDIR</td>
<td>Qt plugins path.</td>
</tr>
</tbody>
</table>

6.12.2. Component Selection

Individual Qt tool and library dependencies must be specified in `USE_QT`. Every component can be suffixed with `_build` or `_run`, the suffix indicating whether the dependency on the component is at buildtime or runtime. If unsuffixed, the component will be depended on at both build- and runtime. Usually, library components are specified unsuffixed, tool components are mostly specified with the `_build` suffix and plugin components are specified with the `_run` suffix. The most commonly used components are listed below (all available components are listed in `_USE_QT_ALL` and `_USE_QT5_ONLY` in `/usr/ports/Mk/Uses/qt.mk`):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3d</td>
<td>Qt3D module</td>
</tr>
<tr>
<td>assistant</td>
<td>Qt 5 documentation browser</td>
</tr>
<tr>
<td>canvas3d</td>
<td>Qt canvas3d module</td>
</tr>
<tr>
<td>charts</td>
<td>Qt 5 charts module</td>
</tr>
<tr>
<td>concurrent</td>
<td>Qt multi-threading module</td>
</tr>
<tr>
<td>connectivity</td>
<td>Qt connectivity (Bluetooth/NFC) module</td>
</tr>
<tr>
<td>core</td>
<td>Qt core non-graphical module</td>
</tr>

</tr>
<tr>
<td>qmake</td>
<td>Makefile generator/build utility</td>
</tr>
</tbody>
</table>

**表 23. Available Qt Plugin Components**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>imageformats</td>
<td>plugins for TGA, TIFF, and MNG image formats</td>
</tr>
</tbody>
</table>

**例 71. Selecting Qt 5 Components**

In this example, the ported application uses the Qt 5 graphical user interface library, the Qt 5 core library, all of the Qt 5 code generation tools and Qt 5's Makefile generator. Since the gui library implies a dependency on the core library, core does not need to be specified. The Qt 5 code generation tools moc, uic and rcc, as well as the Makefile generator qmake are only needed at buildtime, thus they are specified with the _build suffix:

```
USES=   qt:5
USE_QT= gui buildtools_build qmake_build
```

**6.12.3. Using qmake**

If the application provides a qmake project file (*.pro), define USES= qmake along with USE_QT. USES= qmake already implies a build dependency on qmake, therefore the qmake component can be omitted from USE_QT. Similar to CMake, qmake supports out-of-source builds, which can be enabled by specifying the outsorce argument (see USES= qmake example). Also see Possible Arguments for USES= qmake.

**表 24. Possible Arguments for USES= qmake**
<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_configure</td>
<td>Do not add the configure target. This is implied by <code>HAS_CONFIGURE=yes</code> and <code>GNU_CONFIGURE=yes</code>. It is required when the build only needs the environment setup from <code>USES= qmake</code>, but otherwise runs <code>qmake</code> on its own.</td>
</tr>
<tr>
<td>no_env</td>
<td>Suppress modification of the configure and make environments. It is only required when <code>qmake</code> is used to configure the software and the build fails to understand the environment setup by <code>USES= qmake</code>.</td>
</tr>
<tr>
<td>norecursive</td>
<td>Do not pass the <code>-recursive</code> argument to <code>qmake</code>.</td>
</tr>
<tr>
<td>outsource</td>
<td>Perform an out-of-source build.</td>
</tr>
</tbody>
</table>

表 25. Variables for Ports That Use `qmake`

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QMAKE_ARGS</td>
<td>Port specific <code>qmake</code> flags to be passed to the <code>qmake</code> binary.</td>
</tr>
<tr>
<td>QMAKE_ENV</td>
<td>Environment variables to be set for the <code>qmake</code> binary. The default is <code>${CONFIGURE_ENV}</code>.</td>
</tr>
<tr>
<td>QMAKE_SOURCE_PATH</td>
<td>Path to <code>qmake</code> project files (.pro). The default is <code>${WRKSRC}</code> if an out-of-source build is requested, empty otherwise.</td>
</tr>
</tbody>
</table>

When using `USES= qmake`, these settings are deployed:

```
CONFIGURE_ARGS+=  --with-qt-includes=${QT_INCDIR} \                      
                 --with-qt-libraries=${QT_LIBDIR} \                           
                 --with-extra-libs=${LOCALBASE}/lib \                         
                 --with-extra-includes=${LOCALBASE}/include

CONFIGURE_ENV+= QTDIR="${QT_PREFIX}" QMAKE="${QMAKE}" \             
               MOC="${MOC}" RCC="${RCC}" UIC="${UIC}" \                
               QMAKESPEC="${QMAKESPEC}"

PLIST_SUB+= QT_INCDIR=${QT_INCDIR_REL} \                                
             QT_LIBDIR=${QT_LIBDIR_REL} \                                
             QT_PLUGINDIR=${QT_PLUGINDIR_REL}
```

Some configure scripts do not support the arguments above. To suppress modification of `CONFIGURE_ENV` and `CONFIGURE_ARGS`, set `USES= qmake:no_env`. 
This snippet demonstrates the use of qmake for a Qt 5 port:

```bash
USES= qmake:outsource qt:5
USE_QT= buildtools_build
```

Qt applications are often written to be cross-platform and often X11/Unix is not the platform they are developed on, which in turn leads to certain loose ends, like:

- **Missing additional include paths.** Many applications come with system tray icon support, but neglect to look for includes and/or libraries in the X11 directories. To add directories to `qmake`’s include and library search paths via the command line, use:

  ```bash
  QMAKE_ARGS+=    INCLUDEPATH+=${LOCALBASE}/include \
  LIBS+=-L${LOCALBASE}/lib
  ```

- **Bogus installation paths.** Sometimes data such as icons or .desktop files are by default installed into directories which are not scanned by XDG-compatible applications. `editors/texmaker` is an example for this - look at patch-texmaker.pro in the files directory of that port for a template on how to remedy this directly in the qmake project file.

### 6.13. Using KDE

#### 6.13.1. KDE Variable Definitions

If the application depends on KDE, set `USES+=kde:5` and `USE_KDE` to the list of required components. `_build` and `_run` suffixes can be used to force components dependency type (for example, `baseapps_run`). If no suffix is set, a default dependency type will be used. To force both types, add the component twice with both suffixes (for example, `ecm_build ecm_run`). Available components are listed below (up-to-date components are also listed in `/usr/ports/Mk/Uses/kde.mk`):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

#### Example 73. **USE_KDE Example**

This is a simple example for a KDE port. **USES= cmake** instructs the port to utilize CMake, a configuration tool widely used by KDE projects (see **Using cmake** for detailed usage). **USE_KDE** brings dependency on KDE libraries. Required KDE components and other dependencies can be determined through the configure log. **USE_KDE** does not imply **USE_QT**. If a port requires some Qt components, specify them in **USE_QT**.

```
USES= cmake kde:5 qt:5
USE_KDE= ecm
USE_QT= core buildtools_build qmake_build
```

### 6.14. Using LXQt

Applications depending on LXQt should set **USES+= lxqt** and set **USE_LXQT** to the list of required components from the table below.

#### Table 27. **Available LXQt Components**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buildtools</td>
<td>Helpers for additional CMake modules</td>
</tr>
<tr>
<td>libfmqt</td>
<td>Libfm Qt bindings</td>
</tr>
<tr>
<td>lxqt</td>
<td>LXQt core library</td>
</tr>
<tr>
<td>qtxdg</td>
<td>Qt implementation of freedesktop.org XDG specifications</td>
</tr>
</tbody>
</table>
**6.15. Using Java**

### 6.15.1. Variable Definitions

If the port needs a Java™ Development Kit (JDK™) to either build, run or even extract the distfile, then define **USE_JAVA**.

There are several JDKs in the ports collection, from various vendors, and in several versions. If the port must use a particular version, specify it using the **JAVA_VERSION** variable. The most current version is `java/openjdk16`, with `java/openjdk15`, `java/openjdk14`, `java/openjdk13`, `java/openjdk12`, `java/openjdk11`, `java/openjdk8`, and `java/openjdk7` also available.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Means</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>USE_JAVA</strong></td>
<td>Define for the remaining variables to have any effect.</td>
</tr>
<tr>
<td><strong>JAVA_VERSION</strong></td>
<td>List of space-separated suitable Java versions for the port. An optional &quot;+&quot; allows specifying a range of versions (allowed values: 7[+] 8[+] 11[+] 12[+] 13[+] 14[+] 15[+] 16[+]).</td>
</tr>
<tr>
<td><strong>JAVA_OS</strong></td>
<td>List of space-separated suitable JDK port operating systems for the port (allowed values: native linux).</td>
</tr>
<tr>
<td><strong>JAVA_VENDOR</strong></td>
<td>List of space-separated suitable JDK port vendors for the port (allowed values: openjdk oracle).</td>
</tr>
<tr>
<td><strong>JAVA_BUILD</strong></td>
<td>When set, add the selected JDK port to the build dependencies.</td>
</tr>
<tr>
<td><strong>JAVA_RUN</strong></td>
<td>When set, add the selected JDK port to the run dependencies.</td>
</tr>
<tr>
<td><strong>JAVA_EXTRACT</strong></td>
<td>When set, add the selected JDK port to the extract dependencies.</td>
</tr>
</tbody>
</table>

Below is the list of all settings a port will receive after setting **USE_JAVA**:
### Table 29. Variables Provided to Ports That Use Java

<table>
<thead>
<tr>
<th>Variable</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>JAVA_PORT</td>
<td>The name of the JDK port (for example, java/openjdk6).</td>
</tr>
<tr>
<td>JAVA_PORT_VERSION</td>
<td>The full version of the JDK port (for example, 1.6.0). Only the first two digits of this version number are needed, use ${JAVA_PORT_VERSION:C/^([0-9]).([0-9])(.*)$/\1.\2/}.</td>
</tr>
<tr>
<td>JAVA_PORT_OS</td>
<td>The operating system used by the JDK port (for example, 'native').</td>
</tr>
<tr>
<td>JAVA_PORT_VENDOR</td>
<td>The vendor of the JDK port (for example, 'openjdk').</td>
</tr>
<tr>
<td>JAVA_PORT_OS_DESCRIPTION</td>
<td>Description of the operating system used by the JDK port (for example, 'Native').</td>
</tr>
<tr>
<td>JAVA_PORT_VENDOR_DESCRIPTION</td>
<td>Description of the vendor of the JDK port (for example, 'OpenJDK BSD Porting Team').</td>
</tr>
<tr>
<td>JAVA_HOME</td>
<td>Path to the installation directory of the JDK (for example, '/usr/local/openjdk6').</td>
</tr>
<tr>
<td>JAVAC</td>
<td>Path to the Java compiler to use (for example, '/usr/local/openjdk6/bin/javac').</td>
</tr>
<tr>
<td>JAR</td>
<td>Path to the jar tool to use (for example, '/usr/local/openjdk6/bin/jar' or '/usr/local/bin/fastjar').</td>
</tr>
<tr>
<td>APPLETVIEWER</td>
<td>Path to the appletviewer utility (for example, '/usr/local/openjdk6/bin/appletviewer').</td>
</tr>
<tr>
<td>JAVA</td>
<td>Path to the java executable. Use this for executing Java programs (for example, '/usr/local/openjdk6/bin/java').</td>
</tr>
<tr>
<td>JAVADOC</td>
<td>Path to the javadoc utility program.</td>
</tr>
<tr>
<td>JAVAH</td>
<td>Path to the javah program.</td>
</tr>
<tr>
<td>JAVAP</td>
<td>Path to the javap program.</td>
</tr>
<tr>
<td>JAVA_KEYTOOL</td>
<td>Path to the keytool utility program.</td>
</tr>
<tr>
<td>JAVA_N2A</td>
<td>Path to the native2ascii tool.</td>
</tr>
<tr>
<td>JAVA_POLICYTOOL</td>
<td>Path to the policytool program.</td>
</tr>
<tr>
<td>JAVA_SERIALVER</td>
<td>Path to the serialver utility program.</td>
</tr>
<tr>
<td>RMIC</td>
<td>Path to the RMI stub/skeleton generator, rmic.</td>
</tr>
<tr>
<td>RMIREGISTRY</td>
<td>Path to the RMI registry program, rmiregistry.</td>
</tr>
<tr>
<td>RMID</td>
<td>Path to the RMI daemon program rmid.</td>
</tr>
<tr>
<td>Variable</td>
<td>Value</td>
</tr>
<tr>
<td>--------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>JAVA_CLASSES</td>
<td>Path to the archive that contains the JDK class files, (\text{${JAVA_HOME}/jre/lib/rt.jar}).</td>
</tr>
</tbody>
</table>

Use the `java-debug` make target to get information for debugging the port. It will display the value of many of the previously listed variables.

Additionally, these constants are defined so all Java ports may be installed in a consistent way:

### Table 30. Constants Defined for Ports That Use Java

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>JAVASHAREDIR</td>
<td>The base directory for everything related to Java. Default: (\text{${PREFIX}/share/java}).</td>
</tr>
<tr>
<td>JAVA_DIST</td>
<td>The directory where JAR files is installed. Default: (\text{${JAVASHAREDIR}/classes}).</td>
</tr>
<tr>
<td>JAVALIBDIR</td>
<td>The directory where JAR files installed by other ports are located. Default: (\text{${LOCALBASE}/share/java/classes}).</td>
</tr>
</tbody>
</table>

The related entries are defined in both `PLIST_SUB` (documented in Changing pkg-plist Based on Make Variables) and `SUB_LIST`.

### 6.15.2. Building with Ant

When the port is to be built using Apache Ant, it has to define `USE_ANT`. Ant is thus considered to be the sub-make command. When no `do-build` target is defined by the port, a default one will be set that runs Ant according to `MAKE_ENV`, `MAKE_ARGS` and `ALL_TARGET`. This is similar to the `USES= gmake` mechanism, which is documented in Building Mechanisms.

### 6.15.3. Best Practices

When porting a Java library, the port has to install the JAR file(s) in \(\text{${JAVA_DIST}}\), and everything else under \(\text{${JAVASHAREDIR}/${PORTNAME}}\) (except for the documentation, see below). To reduce the packing file size, reference the JAR file(s) directly in the Makefile. Use this statement (where `myport.jar` is the name of the JAR file installed as part of the port):

```
PLIST_FILES+=   \(\text{${JAVA_DIST}/myport.jar}\)
```

When porting a Java application, the port usually installs everything under a single directory (including its JAR dependencies). The use of \(\text{${JAVASHAREDIR}/${PORTNAME}}\) is strongly encouraged in this regard. It is up the porter to decide whether the port installs the additional JAR dependencies under this directory or uses the already installed ones (from \(\text{${JAVA_DIST}}\)).

When porting a Java™ application that requires an application server such as www/tomcat7 to run the service, it is quite common for a vendor to distribute a .war. A .war is a Web application ARchive and is extracted when called by the application. Avoid adding a .war to pkg-plist. It is not
considered best practice. An application server will expand war archive, but not clean it up properly if the port is removed. A more desirable way of working with this file is to extract the archive, then install the files, and lastly add these files to pkg-plist.

```
TOMCATDIR= ${LOCALBASE}/apache-tomcat-7.0
WEBAPPDIR= myapplication

post-extract:
    @${MKDIR} ${WRKDIR}/${PORTDIRNAME}
    @${TAR} xf ${WRKDIR}/myapplication.war -C ${WRKDIR}/${PORTDIRNAME}

do-install:
    cd ${WRKDIR} && \
    ${INSTALL} -d -o ${WWWOWN} -g ${WWWGRP} ${TOMCATDIR}/webapps/${PORTDIRNAME}
    cd ${WRKDIR}/${PORTDIRNAME} && ${COPYTREE_SHARE} \* ${WEBAPPDIR}/${PORTDIRNAME}
```

Regardless of the type of port (library or application), the additional documentation is installed in the same location as for any other port. The Javadoc tool is known to produce a different set of files depending on the version of the JDK that is used. For ports that do not enforce the use of a particular JDK, it is therefore a complex task to specify the packing list (pkg-plist). This is one reason why porters are strongly encouraged to use PORTDOCS. Moreover, even if the set of files that will be generated by javadoc can be predicted, the size of the resulting pkg-plist advocates for the use of PORTDOCS.

The default value for DATADIR is ${PREFIX}/share/${PORTNAME}. It is a good idea to override DATADIR to ${JAVASHAREDIR}/${PORTNAME} for Java ports. Indeed, DATADIR is automatically added to PLIST_SUB (documented in Changing pkg-plist Based on Make Variables) so use %%%DATADIR%%% directly in pkg-plist.

As for the choice of building Java ports from source or directly installing them from a binary distribution, there is no defined policy at the time of writing. However, people from the FreeBSD Java Project encourage porters to have their ports built from source whenever it is a trivial task.

All the features that have been presented in this section are implemented in bsd.java.mk. If the port needs more sophisticated Java support, please first have a look at the bsd.java.mk Git log as it usually takes some time to document the latest features. Then, if the needed support that is lacking would be beneficial to many other Java ports, feel free to discuss it on the freebsd-java.

Although there is a java category for PRs, it refers to the JDK porting effort from the FreeBSD Java project. Therefore, submit the Java port in the ports category as for any other port, unless the issue is related to either a JDK implementation or bsd.java.mk.

Similarly, there is a defined policy regarding the CATEGORIES of a Java port, which is detailed in Categorization.

### 6.16. Web Applications, Apache and PHP

6.16.1. Apache

表 31. Variables for Ports That Use Apache

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USE_APACHE</td>
<td>The port requires Apache. Possible values: yes (gets any version), 22, 24, 22-24, 22+, etc. The default APACHE version is 22. More details are available in ports/Mk/bsd.apache.mk and at wiki.freebsd.org/Apache/.</td>
</tr>
<tr>
<td>APXS</td>
<td>Full path to the <code>apxs</code> binary. Can be overridden in the port.</td>
</tr>
<tr>
<td>HTTPD</td>
<td>Full path to the <code>httpd</code> binary. Can be overridden in the port.</td>
</tr>
<tr>
<td>APACHE_VERSION</td>
<td>The version of present Apache installation (read-only variable). This variable is only available after inclusion of bsd.port.pre.mk. Possible values: 22, 24.</td>
</tr>
<tr>
<td>APACHEMODDIR</td>
<td>Directory for Apache modules. This variable is automatically expanded in pkg-plist.</td>
</tr>
<tr>
<td>APACHEINCLUDEDIR</td>
<td>Directory for Apache headers. This variable is automatically expanded in pkg-plist.</td>
</tr>
<tr>
<td>APACHEETCDIR</td>
<td>Directory for Apache configuration files. This variable is automatically expanded in pkg-plist.</td>
</tr>
</tbody>
</table>

表 32. Useful Variables for Porting Apache Modules

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODULENAME</td>
<td>Name of the module. Default value is PORTNAME. Example: <code>mod_hello</code></td>
</tr>
<tr>
<td>SHORTMODNAME</td>
<td>Short name of the module. Automatically derived from MODULENAME, but can be overridden. Example: <code>hello</code></td>
</tr>
<tr>
<td>AP_FAST_BUILD</td>
<td>Use <code>apxs</code> to compile and install the module.</td>
</tr>
<tr>
<td>AP_GENPLIST</td>
<td>Also automatically creates a pkg-plist.</td>
</tr>
<tr>
<td>AP_INC</td>
<td>Adds a directory to a header search path during compilation.</td>
</tr>
<tr>
<td>AP_LIB</td>
<td>Adds a directory to a library search path during compilation.</td>
</tr>
<tr>
<td>AP_EXTRAS</td>
<td>Additional flags to pass to <code>apxs</code>.</td>
</tr>
</tbody>
</table>

6.16.2. Web Applications

Web applications must be installed into PREFIX/www/appname. This path is available both in Makefile and in pkg-plist as WWWDIR, and the path relative to PREFIX is available in Makefile as WWWDIR_REL.
The user and group of web server process are available as `WWWOWN` and `WWWGRP`, in case the ownership of some files needs to be changed. The default values of both are `www`. Use `WWWOWN?= myuser` and `WWWGRP?= mygroup` if the port needs different values. This allows the user to override them easily.

Use `WWWOWN` and `WWWGRP` sparingly. Remember that every file the web server can write to is a security risk waiting to happen.

Do not depend on Apache unless the web app explicitly needs Apache. Respect that users may wish to run a web application on a web server other than Apache.

### 6.16.3. PHP

PHP web applications declare their dependency on it with `USES=php`. See `php` for more information.

### 6.16.4. PEAR Modules

Porting PEAR modules is a very simple process.

Add `USES=pear` to the port's Makefile. The framework will install the relevant files in the right places and automatically generate the plist at install time.

**Example Makefile for PEAR Class**

```makefile
PORTNAME=       Date
DISTVERSION=    1.4.3
CATEGORIES= devel www pear

MAINTAINER= example@domain.com
COMMENT=    PEAR Date and Time Zone Classes

USES=   pear
.include <bsd.port.mk>
```

PEAR modules will automatically be flavorized using PHP flavors.

If a non default `PEAR_CHANNEL` is used, the build and run-time dependencies will automatically be added.

PEAR modules do not need to defined `PKGNAMEPREFIX` it is automatically filled in using `PEAR_PKGNAMEPREFIX`. If a port needs to add to `PKGNAMEPREFIX`, it must also use `PEAR_PKGNAMEPREFIX` to differentiate between different flavors.

### 6.16.4.1. Horde Modules

In the same way, porting Horde modules is a simple process.
Add **USES=horde** to the port's Makefile. The framework will install the relevant files in the right places and automatically generate the plist at install time.

The **USE_HORDE_BUILD** and **USE_HORDE_RUN** variables can be used to add buildtime and runtime dependencies on other Horde modules. See Mk/Uses/horde.mk for a complete list of available modules.

### 例 76. Example Makefile for Horde Module

```makefile
PORTNAME=   Horde_Core
DISTVERSION=    2.14.0
CATEGORIES= devel www pear

MAINTAINER= horde@FreeBSD.org
COMMENT=    Horde Core Framework libraries

OPTIONS_DEFINE= KOLAB SOCKETS
KOLAB_DESC= Enable Kolab server support
SOCKETS_DESC=   Depend on sockets PHP extension

USES=   horde
USE_PHP=    session

USE_HORDE_BUILD= Horde_Role
USE_HORDE_RUN= Horde_Role Horde_History Horde_Pack \             Horde_Text_Filter Horde_View

KOLAB_USE=  HORDE_RUN=Horde_Kolab_Server,Horde_Kolab_Session
SOCKETS_USE=    PHP=sockets

.include <bsd.port.mk>
```

As Horde modules are also PEAR modules they will also automatically be flavorized using **PHP flavors**.

### 6.17. Using Python

The Ports Collection supports parallel installation of multiple Python versions. Ports must use a correct **python** interpreter, according to the user-settable **PYTHON_VERSION**. Most prominently, this means replacing the path to **python** executable in scripts with the value of **PYTHON_CMD**.

Ports that install files under **PYTHON_SITELIBDIR** must use the **pyXY**- package name prefix, so their package name embeds the version of Python they are installed into.

```
PKGNAMEPREFIX=  ${PYTHON_PKGNAMEPREFIX}
```

172
### Most Useful Variables for Ports That Use Python

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USES=python</td>
<td>The port needs Python. The minimal required version can be specified with values such as 2.7+. Version ranges can also be specified by separating two version numbers with a dash: USES=python:3.2-3.3</td>
</tr>
<tr>
<td>USE_PYTHON=distutils</td>
<td>Use Python distutils for configuring, compiling, and installing. This is required when the port comes with setup.py. This overrides the do-build and do-install targets and may also override do-configure if GNU_CONFIGURE is not defined. Additionally, it implies USE_PYTHON=flavors.</td>
</tr>
<tr>
<td>USE_PYTHON=autoplist</td>
<td>Create the packaging list automatically. This also requires USE_PYTHON=distutils to be set.</td>
</tr>
<tr>
<td>USE_PYTHON=concurrent</td>
<td>The port will use an unique prefix, typically PYTHON_PKGNAMEPREFIX for certain directories, such as EXAMPLESDIR and DOCSDIR and also will append a suffix, the python version from PYTHON_VER, to binaries and scripts to be installed. This allows ports to be installed for different Python versions at the same time, which otherwise would install conflicting files.</td>
</tr>
<tr>
<td>USE_PYTHON=flavors</td>
<td>The port does not use distutils but still supports multiple Python versions. FLAVORS will be set to the supported Python versions. See USES=python and Flavors for more information.</td>
</tr>
<tr>
<td>USE_PYTHON=optsuffix</td>
<td>If the current Python version is not the default version, the port will gain PKGNAMESUFFIX=${PYTHON_PKGNAMEPREFIX}=${PYTHON_PKGNAMEPREFIX}. Only useful with flavors.</td>
</tr>
<tr>
<td>PYTHON_PKGNAMEPREFIX</td>
<td>Used as a PKNAMEPREFIX to distinguish packages for different Python versions. Example: py27-</td>
</tr>
<tr>
<td>PYTHON_SITELIBDIR</td>
<td>Location of the site-packages tree, that contains installation path of Python (usually LOCALBASE). PYTHON_SITELIBDIR can be very useful when installing Python modules.</td>
</tr>
<tr>
<td>PYTHONPREFIX_SITELIBDIR</td>
<td>The PREFIX-clean variant of PYTHON_SITELIBDIR. Always use %%PYTHON_SITELIBDIR%% in pkg-plist when possible. The default value of %%PYTHON_SITELIBDIR%% is lib/python%%PYTHON_VERSION%%/site-packages</td>
</tr>
<tr>
<td>PYTHON_CMD</td>
<td>Python interpreter command line, including version number.</td>
</tr>
</tbody>
</table>
### Python Module Dependency Helpers

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PYNUMERIC</td>
<td>Dependency line for numeric extension.</td>
</tr>
<tr>
<td>PYNUMPY</td>
<td>Dependency line for the new numeric extension, numpy. (PYNUMERIC is deprecated by upstream vendor).</td>
</tr>
<tr>
<td>PYXML</td>
<td>Dependency line for XML extension (not needed for Python 2.0 and higher as it is also in base distribution).</td>
</tr>
<tr>
<td>PY_ENUM34</td>
<td>Conditional dependency on <code>devel/py-enum34</code> depending on the Python version.</td>
</tr>
<tr>
<td>PY_ENUM_COMPAT</td>
<td>Conditional dependency on <code>devel/py-enum-compat</code> depending on the Python version.</td>
</tr>
<tr>
<td>PY_PATHLIB</td>
<td>Conditional dependency on <code>devel/py-pathlib</code> depending on the Python version.</td>
</tr>
<tr>
<td>PY_IPADDRESS</td>
<td>Conditional dependency on <code>net/py-ipaddress</code> depending on the Python version.</td>
</tr>
<tr>
<td>PY_FUTURES</td>
<td>Conditional dependency on <code>devel/py-futures</code> depending on the Python version.</td>
</tr>
</tbody>
</table>

A complete list of available variables can be found in `/usr/ports/Mk/Uses/python.mk`.

All dependencies to Python ports using Python flavors (either with `USE_PYTHON=distutils` or `USE_PYTHON=flavors`) must have the Python flavor appended to their origin using `@${PY_FLAVOR}`. See Makefile for a Simple Python Module.

**Example 77. Makefile for a Simple Python Module**

```
PORTNAME= sample
DISTVERSION= 1.2.3
CATEGORIES= devel

MAINTAINER= john@doe.tld
COMMENT= Python sample module

RUN_DEPENDS= ${PYTHON_PKGNAMEPREFIX}six>0:devel/py-six@${PY_FLAVOR}
USES= python
USE_PYTHON= autoplist distutils
.include <bsd.port.mk>
```

Some Python applications claim to have DESTDIR support (which would be required for staging) but it is broken (Mailman up to 2.1.16, for instance). This can be worked around by recompiling the
scripts. This can be done, for example, in the post-build target. Assuming the Python scripts are supposed to reside in PYTHONPREFIX_SITELIBDIR after installation, this solution can be applied:

```
(cd ${STAGEDIR}${PREFIX} \
  && ${PYTHON_CMD} ${PYTHON_LIBDIR}/compileall.py \ 
  -d ${PREFIX} -f ${PYTHONPREFIX_SITELIBDIR:S;${PREFIX}/;;})
```

This recompiles the sources with a path relative to the stage directory, and prepends the value of PREFIX to the file name recorded in the byte-compiled output file by -d. -f is required to force recompilation, and the :S;${PREFIX}/;; strips prefixes from the value of PYTHONPREFIX_SITELIBDIR to make it relative to PREFIX.

### 6.18. Using Tcl/Tk

The Ports Collection supports parallel installation of multiple Tcl/Tk versions. Ports should try to support at least the default Tcl/Tk version and higher with USES=tcl. It is possible to specify the desired version of tcl by appending :_xx_, for example, USES=tcl:85.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCL_VER</td>
<td>chosen major.minor version of Tcl</td>
</tr>
<tr>
<td>TCLSH</td>
<td>full path of the Tcl interpreter</td>
</tr>
<tr>
<td>TCL_LIBDIR</td>
<td>path of the Tcl libraries</td>
</tr>
<tr>
<td>TCL_INCLUDEDIR</td>
<td>path of the Tcl C header files</td>
</tr>
<tr>
<td>TK_VER</td>
<td>chosen major.minor version of Tk</td>
</tr>
<tr>
<td>WISH</td>
<td>full path of the Tk interpreter</td>
</tr>
<tr>
<td>TK_LIBDIR</td>
<td>path of the Tk libraries</td>
</tr>
<tr>
<td>TK_INCLUDEDIR</td>
<td>path of the Tk C header files</td>
</tr>
</tbody>
</table>

See the USES=tcl and USES=tk of Using USES Macros for a full description of those variables. A complete list of those variables is available in /usr/ports/Mk/Uses/tcl.mk.

### 6.19. Using Ruby

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USE_RUBY</td>
<td>Adds build and run dependencies on Ruby.</td>
</tr>
<tr>
<td>USE_RUBY_EXTCONF</td>
<td>The port uses extconf.rb to configure.</td>
</tr>
<tr>
<td>USE_RUBY_SETUP</td>
<td>The port uses setup.rb to configure.</td>
</tr>
<tr>
<td>RUBY_SETUP</td>
<td>Override the name of the setup script from setup.rb. Another common value is install.rb.</td>
</tr>
</tbody>
</table>

This table shows the selected variables available to port authors via the ports infrastructure. These
variables are used to install files into their proper locations. Use them in pkg-plist as much as possible. Do not redefine these variables in the port.

表 37. Selected Read-Only Variables for Ports That Use Ruby

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>RUBY_PKGNAMEPREFIX</td>
<td>Used as a PKGNAMEPREFIX to distinguish packages for different Ruby versions.</td>
<td>ruby19-</td>
</tr>
<tr>
<td>RUBY_VERSION</td>
<td>Full version of Ruby in the form of x.y.z[.p].</td>
<td>1.9.3.484</td>
</tr>
<tr>
<td>RUBY_SITELIBDIR</td>
<td>Architecture independent libraries installation path.</td>
<td>/usr/local/lib/ruby/site_ruby/1.9</td>
</tr>
<tr>
<td>RUBY_SITEARCHLIBDIR</td>
<td>Architecture dependent libraries installation path.</td>
<td>/usr/local/lib/ruby/site_ruby/1.9/amd64-freebsd10</td>
</tr>
<tr>
<td>RUBY_MODDOCDIR</td>
<td>Module documentation installation path.</td>
<td>/usr/local/share/doc/ruby19/patsy</td>
</tr>
<tr>
<td>RUBY_MODEXAMPLESDIR</td>
<td>Module examples installation path.</td>
<td>/usr/local/share/examples/ruby19/patsy</td>
</tr>
</tbody>
</table>

A complete list of available variables can be found in /usr/ports/Mk/bsd.ruby.mk.

6.20. Using SDL

USE_SDL is used to autoconfigure the dependencies for ports which use an SDL based library like devel/sdl12 and graphics/sdl_image.

These SDL libraries for version 1.2 are recognized:

- sdl: devel/sdl12
- console: devel/sdl_console
- gfx: graphics/sdl_gfx
- image: graphics/sdl_image
- mixer: audio/sdl_mixer
- mm: devel/sdmm
- net: net/sdl_net
- pango: x11-toolkits/sdl_pango
- sound: audio/sdl_sound
- ttf: graphics/sdl_ttf

These SDL libraries for version 2.0 are recognized:

- sdl: devel/sdl20
• gfx: graphics/sdl2_gfx
• image: graphics/sdl2_image
• mixer: audio/sdl2.mixer
• net: net/sdl2_net
• ttf: graphics/sdl2_ttf

Therefore, if a port has a dependency on net/sdl2_net and audio/sdl2.mixer, the syntax will be:

```
USE_SDL= net mixer
```

The dependency devel/sdl12, which is required by net/sdl2_net and audio/sdl2.mixer, is automatically added as well.

Using USE_SDL with entries for SDL 1.2, it will automatically:

- Add a dependency on sdl12-config to BUILD_DEPENDS
- Add the variable SDL_CONFIG to CONFIGURE_ENV
- Add the dependencies of the selected libraries to LIB_DEPENDS

Using USE_SDL with entries for SDL 2.0, it will automatically:

- Add a dependency on sdl2-config to BUILD_DEPENDS
- Add the variable SDL2_CONFIG to CONFIGURE_ENV
- Add the dependencies of the selected libraries to LIB_DEPENDS

### 6.21. Using wxWidgets

This section describes the status of the wxWidgets libraries in the ports tree and its integration with the ports system.

#### 6.21.1. Introduction

There are many versions of the wxWidgets libraries which conflict between them (install files under the same name). In the ports tree this problem has been solved by installing each version under a different name using version number suffixes.

The obvious disadvantage of this is that each application has to be modified to find the expected version. Fortunately, most of the applications call the `wx-config` script to determine the necessary compiler and linker flags. The script is named differently for every available version. Majority of applications respect an environment variable, or accept a configure argument, to specify which `wx-config` script to call. Otherwise they have to be patched.

#### 6.21.2. Version Selection

To make the port use a specific version of wxWidgets there are two variables available for defining
(if only one is defined the other will be set to a default value):

### Table 38. Variables to Select wxWidgets Versions

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>USE_WX</td>
<td>List of versions the port can use</td>
<td>All available versions</td>
</tr>
<tr>
<td>USE_WX_NOT</td>
<td>List of versions the port cannot use</td>
<td>None</td>
</tr>
</tbody>
</table>

The available wxWidgets versions and the corresponding ports in the tree are:

### Table 39. Available wxWidgets Versions

<table>
<thead>
<tr>
<th>Version</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.8</td>
<td>x11-toolkits/wxgtk28</td>
</tr>
<tr>
<td>3.0</td>
<td>x11-toolkits/wxgtk30</td>
</tr>
</tbody>
</table>

The variables in Variables to Select wxWidgets Versions can be set to one or more of these combinations separated by spaces:

### Table 40. wxWidgets Version Specifications

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single version</td>
<td>2.8</td>
</tr>
<tr>
<td>Ascending range</td>
<td>2.8+</td>
</tr>
<tr>
<td>Descending range</td>
<td>3.0-</td>
</tr>
<tr>
<td>Full range (must be ascending)</td>
<td>2.8-3.0</td>
</tr>
</tbody>
</table>

There are also some variables to select the preferred versions from the available ones. They can be set to a list of versions, the first ones will have higher priority.

### Table 41. Variables to Select Preferred wxWidgets Versions

<table>
<thead>
<tr>
<th>Name</th>
<th>Designed for</th>
</tr>
</thead>
<tbody>
<tr>
<td>WANT_WX_VER</td>
<td>the port</td>
</tr>
<tr>
<td>WITH_WX_VER</td>
<td>the user</td>
</tr>
</tbody>
</table>

### 6.21.3. Component Selection

There are other applications that, while not being wxWidgets libraries, are related to them. These applications can be specified in WX_COMPS. These components are available:

### Table 42. Available wxWidgets Components

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Version restriction</th>
</tr>
</thead>
<tbody>
<tr>
<td>wx</td>
<td>main library</td>
<td>none</td>
</tr>
<tr>
<td>contrib</td>
<td>contributed libraries</td>
<td>none</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Version restriction</td>
</tr>
<tr>
<td>----------</td>
<td>--------------------------</td>
<td>---------------------</td>
</tr>
<tr>
<td>python</td>
<td>wxPython (Python bindings)</td>
<td>2.8-3.0</td>
</tr>
</tbody>
</table>

The dependency type can be selected for each component by adding a suffix separated by a semicolon. If not present then a default type will be used (see Default wxWidgets Dependency Types). These types are available:

### 表 43. Available wxWidgets Dependency Types

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>build</td>
<td>Component is required for building, equivalent to BUILD DEPENDS</td>
</tr>
<tr>
<td>run</td>
<td>Component is required for running, equivalent to RUN DEPENDS</td>
</tr>
<tr>
<td>lib</td>
<td>Component is required for building and running, equivalent to LIB DEPENDS</td>
</tr>
</tbody>
</table>

The default values for the components are detailed in this table:

### 表 44. Default wxWidgets Dependency Types

<table>
<thead>
<tr>
<th>Component</th>
<th>Dependency type</th>
</tr>
</thead>
<tbody>
<tr>
<td>wx</td>
<td>lib</td>
</tr>
<tr>
<td>contrib</td>
<td>lib</td>
</tr>
<tr>
<td>python</td>
<td>run</td>
</tr>
<tr>
<td>mozilla</td>
<td>lib</td>
</tr>
<tr>
<td>svg</td>
<td>lib</td>
</tr>
</tbody>
</table>

例 78. Selecting wxWidgets Components

This fragment corresponds to a port which uses wxWidgets version 2.4 and its contributed libraries.

```
USE_WX=     2.8
WX_COMPS=   wx contrib
```

### 6.21.4. Detecting Installed Versions

To detect an installed version, define WANT_WX. If it is not set to a specific version then the components will have a version suffix. HAVE_WX will be filled after detection.
79. Detecting Installed wxWidgets Versions and Components

This fragment can be used in a port that uses wxWidgets if it is installed, or an option is selected.

```bash
WANT_WX= yes
.include <bsd.port.pre.mk>
.if defined(WITH_WX) || !empty(PORT_OPTIONS:MWX) || !empty(HAVE_WX:Mwx-2.8)
USE_WX= 2.8
CONFIGURE_ARGS+= --enable-wx
.endif
```

This fragment can be used in a port that enables wxPython support if it is installed or if an option is selected, in addition to wxWidgets, both version 2.8.

```bash
USE_WX= 2.8
WX_COMPS= wx
WANT_WX= 2.8
.include <bsd.port.pre.mk>
.if defined(WITH_WXPYTHON) || !empty(PORT_OPTIONS:MWXPYTHON) || !empty(HAVE_WX:Mpython)
WX_COMPS+= python
CONFIGURE_ARGS+= --enable-wxpython
.endif
```

### 6.21.5. Defined Variables

These variables are available in the port (after defining one from Variables to Select wxWidgets Versions).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WX_CONFIG</td>
<td>The path to the wxWidgets <code>wx-config</code> script (with different name)</td>
</tr>
<tr>
<td>WXRC_CMD</td>
<td>The path to the wxWidgets <code>wxrc</code> program (with different name)</td>
</tr>
<tr>
<td>WX_VERSION</td>
<td>The wxWidgets version that is going to be used (for example, 2.6)</td>
</tr>
</tbody>
</table>
6.21.6. Processing in bsd.port.pre.mk

Define `WX_PREMK` to be able to use the variables right after including `bsd.port.pre.mk`.

When defining `WX_PREMK`, then the version, dependencies, components and defined variables will not change if modifying the wxWidgets port variables after including `bsd.port.pre.mk`.

Example 80. Using wxWidgets Variables in Commands

This fragment illustrates the use of `WX_PREMK` by running the `wx-config` script to obtain the full version string, assign it to a variable and pass it to the program.

```bash
USE_WX=     2.8
WX_PREMK=   yes
.include <bsd.port.pre.mk>

ifdef (${WX_CONFIG})
    VER_STR=   ${WX_CONFIG} --release
    PLIST_SUB+= VERSION="${VER_STR}"
endif
```

The wxWidgets variables can be safely used in commands when they are inside targets without the need of `WX_PREMK`.

6.21.7. Additional configure Arguments

Some GNU `configure` scripts cannot find wxWidgets with just the `WX_CONFIG` environment variable set, requiring additional arguments. `WX_CONF_ARGS` can be used for provide them.

<table>
<thead>
<tr>
<th>Possible value</th>
<th>Resulting argument</th>
</tr>
</thead>
<tbody>
<tr>
<td>absolute</td>
<td><code>--with-wx-config=${WX_CONFIG}</code></td>
</tr>
<tr>
<td>relative</td>
<td><code>--with-wx=${LOCALBASE} --with-wx-config=${WX_CONFIG:t}</code></td>
</tr>
</tbody>
</table>

6.22. Using Lua

This section describes the status of the Lua libraries in the ports tree and its integration with the ports system.
6.22.1. Introduction

There are many versions of the Lua libraries and corresponding interpreters, which conflict between them (install files under the same name). In the ports tree this problem has been solved by installing each version under a different name using version number suffixes.

The obvious disadvantage of this is that each application has to be modified to find the expected version. But it can be solved by adding some additional flags to the compiler and linker.

Applications that use Lua should normally build for just one version. However, loadable modules for Lua are built in a separate flavor for each Lua version that they support, and dependencies on such modules should specify the flavor using the `@${LUA_FLAVOR}` suffix on the port origin.

6.22.2. Version Selection

A port using Lua should have a line of this form:

```
USES= lua
```

If a specific version of Lua, or range of versions, is needed, it can be specified as a parameter in the form `XY` (which may be used multiple times), `XY+`, `-XY`, or `XY-ZA`. The default version of Lua as set via `DEFAULT_VERSIONS` will be used if it falls in the requested range, otherwise the closest requested version to the default will be used. For example:

```
USES= lua:52-53
```

Note that no attempt is made to adjust the version selection based on the presence of any already-installed Lua version.

The `XY+` form of version specification should not be used without careful consideration; the Lua API changes to some extent in every version, and configuration tools like CMake or Autoconf will often fail to work on future versions of Lua until updated to do so.

6.22.3. Configuration and Compiler flags

Software that uses Lua may have been written to auto-detect the Lua version in use. In general ports should override this assumption, and force the use of the specific Lua version selected as described above. Depending on the software being ported, this might require any or all of:

- Using `LUA_VER` as part of a parameter to the software's configuration script via `CONFIGURE_ARGS` or `CONFIGURE_ENV` (or equivalent for other build systems);
- Adding `-I${LUA_INCDIR}`, `-L${LUA_LIBDIR}`, and `-llua-${LUA_VER}` to `CFLAGS`, `LDFLAGS`, `LIBS` respectively as appropriate;
- Patch the software's configuration or build files to select the correct version.
6.22.4. Version Flavors

A port which installs a Lua module (rather than an application that simply makes use of Lua) should build a separate flavor for each supported Lua version. This is done by adding the `module` parameter:

```
USES=  lua:module
```

A version number or range of versions can be specified as well; use a comma to separate parameters.

Since each flavor must have a different package name, the variable `LUA_PKGNAMEPREFIX` is provided which will be set to an appropriate value; the intended usage is:

```
PKGNAMEPREFIX=  ${LUA_PKGNAMEPREFIX}
```

Module ports should normally install files only to `LUA_MODLIBDIR`, `LUA_MODSHAREDIR`, `LUA_DOCSDIR`, and `LUA_EXAMPLESDIR`, all of which are set up to refer to version-specific subdirectories. Installing any other files must be done with care to avoid conflicts between versions.

A port (other than a Lua module) which wishes to build a separate package for each Lua version should use the `flavors` parameter:

```
USES=  lua:flavors
```

This operates the same way as the `module` parameter described above, but without the assumption that the package should be documented as a Lua module (so `LUA_DOCSDIR` and `LUA_EXAMPLESDIR` are not defined by default). However, the port may choose to define `LUA_DOCSUBDIR` as a suitable subdirectory name (usually the port's `PORTNAME` as long as this does not conflict with the `PORTNAME` of any module), in which case the framework will define both `LUA_DOCSDIR` and `LUA_EXAMPLESDIR`.

As with module ports, a flavored port should avoid installing files that would conflict between versions. Typically this is done by adding `LUA_VER_STR` as a suffix to program names (e.g. using `uniquefiles`), and otherwise using either `LUA_VER` or `LUA_VER_STR` as part of any other files or subdirectories used outside of `LUA_MODLIBDIR` and `LUA_MODSHAREDIR`.

6.22.5. Defined Variables

These variables are available in the port.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LUA_VER</td>
<td>The Lua version that is going to be used (for example, 5.1)</td>
</tr>
</tbody>
</table>
### Name

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LUA_VER_STR</td>
<td>The Lua version without the dots (for example, 51)</td>
</tr>
<tr>
<td>LUA_FLAVOR</td>
<td>The flavor name corresponding to the selected Lua version, to be used for specifying dependencies</td>
</tr>
<tr>
<td>LUA_BASE</td>
<td>The prefix that should be used to locate Lua (and components) that are already installed</td>
</tr>
<tr>
<td>LUA_PREFIX</td>
<td>The prefix where Lua (and components) are to be installed by this port</td>
</tr>
<tr>
<td>LUA_INCDIR</td>
<td>The directory where Lua header files are installed</td>
</tr>
<tr>
<td>LUA_LIBDIR</td>
<td>The directory where Lua libraries are installed</td>
</tr>
<tr>
<td>LUA_REFMLIBDIR</td>
<td>The directory where Lua module libraries (.so) that are already installed are to be found</td>
</tr>
<tr>
<td>LUA_REFMODSHAREDIR</td>
<td>The directory where Lua module libraries (.so) that are already installed are to be found</td>
</tr>
<tr>
<td>LUA_MODLIBDIR</td>
<td>The directory where Lua module libraries (.so) are to be installed by this port</td>
</tr>
<tr>
<td>LUA_MODSHAREDIR</td>
<td>The directory where Lua modules (.lua) are to be installed by this port</td>
</tr>
<tr>
<td>LUA_PKGNAMEPREFIX</td>
<td>The package name prefix used by Lua modules</td>
</tr>
<tr>
<td>LUA_CMD</td>
<td>The name of the Lua interpreter (e.g. lua53)</td>
</tr>
<tr>
<td>LUAC_CMD</td>
<td>The name of the Lua compiler (e.g. luac53)</td>
</tr>
</tbody>
</table>

These additional variables are available for ports that specified the `module` parameter:

表 48. Variables Defined for Lua Module Ports

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LUA_DOCSDIR</td>
<td>the directory to which the module’s documentation should be installed.</td>
</tr>
<tr>
<td>LUA_EXAMPLESDIR</td>
<td>the directory to which the module’s example files should be installed.</td>
</tr>
</tbody>
</table>

### 6.22.6. Examples
This example shows how to reference a Lua module required at run time. Notice that the reference must specify a flavor.

```makefile
PORTNAME= sample
DISTVERSION= 1.2.3
CATEGORIES= whatever

MAINTAINER= john@doe.tld
COMMENT= Sample

RUN_DEPENDS= ${LUA_REFMODLIBDIR}/lpeg.so:devel/lua-lpeg@${LUA_FLAVOR}

USES= lua

.include <bsd.port.mk>
```

Example 82. Makefile for a simple Lua module

```makefile
PORTNAME= sample
DISTVERSION= 1.2.3
CATEGORIES= whatever
PKGNAMEPREFIX= ${LUA_PKGNAMEPREFIX}

MAINTAINER= john@doe.tld
COMMENT= Sample

USES= lua:module

DOCSDIR= ${LUA_DOCSDIR}

.include <bsd.port.mk>
```

## 6.23. Using `iconv`

FreeBSD has a native `iconv` in the operating system.

For software that needs `iconv`, define `USES=iconv`.

When a port defines `USES=iconv`, these variables will be available:
<table>
<thead>
<tr>
<th>Variable name</th>
<th>Purpose</th>
<th>Port icnv (when using WCHAR_T or //TRANSLIT extensions)</th>
<th>Base icnv</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICONV_CMD</td>
<td>Directory where the <code>iconv</code> binary resides</td>
<td>${LOCALBASE}/bin/iconv</td>
<td>/usr/bin/iconv</td>
</tr>
<tr>
<td>ICONV_LIB</td>
<td>ld argument to link to libiconv (if needed)</td>
<td>-liconv</td>
<td>(empty)</td>
</tr>
<tr>
<td>ICONV_PREFIX</td>
<td>Directory where the <code>iconv</code> implementation resides (useful for configure scripts)</td>
<td>${LOCALBASE}</td>
<td>/usr</td>
</tr>
<tr>
<td>ICONV_CONFIGURE_ARG</td>
<td>Preconstructed configure argument for configure scripts</td>
<td>--with-libiconv-prefix=${LOCALBASE}</td>
<td>(empty)</td>
</tr>
<tr>
<td>ICONV_CONFIGURE_BASE</td>
<td>Preconstructed configure argument for configure scripts</td>
<td>--with-libiconv=${LOCALBASE}</td>
<td>(empty)</td>
</tr>
</tbody>
</table>

These two examples automatically populate the variables with the correct value for systems using converters/libiconv or the native `iconv` respectively:

**Example 83. Simple iconv Usage**

```
USES= iconv
LDFLAGS+= -L${LOCALBASE}/lib ${ICONV_LIB}
```

**Example 84. iconv Usage with configure**

```
USES= iconv
CONFIGURE_ARGS+=${ICONV_CONFIGURE_ARG}
```

As shown above, ICONV_LIB is empty when a native `iconv` is present. This can be used to detect the native `iconv` and respond appropriately.

Sometimes a program has an ld argument or search path hardcoded in a Makefile or configure script. This approach can be used to solve that problem:
例 85. Fixing Hardcoded -liconv

USES= iconv

post-patch:
  @$(REINPLACE_CMD) -e 's/-liconv/${ICONV_LIB}/' ${WRKSRC}/Makefile

In some cases it is necessary to set alternate values or perform operations depending on whether there is a native iconv. bsd.port.pre.mk must be included before testing the value of ICONV_LIB:

例 86. Checking for Native iconv Availability

USES= iconv

.include <bsd.port.pre.mk>

post-patch:
.include <bsd.port.post.mk>

.post-patch:
.if empty(ICONV_LIB)
  # native iconv detected
  @$(REINPLACE_CMD) -e 's|iconv||' ${WRKSRC}/Config.sh
.endif

.include <bsd.port.post.mk>

6.24. Using Xfce

Ports that need Xfce libraries or applications set USES=xfce.

Specific Xfce library and application dependencies are set with values assigned to USE_XFCE. They are defined in /usr/ports/Mk/Uses/xfce.mk. The possible values are:

Values of USE_XFCE

garcon
  sysutils/garcon

libexo
  x11/libexo

libgui
  x11-toolkits/libxfce4gui

libmenu
  x11/libxfce4menu
libutil
  x11/libxfce4util

panel
  x11-wm/xfce4-panel

thunar
  x11-fm/thunar

xfconf
  x11/xfce4-conf

例 87. USES=xfce Example

| USES=       xfce  |
| USE_XFCE= libmenu |

例 88. Using Xfce’s Own GTK2 Widgets

In this example, the ported application uses the GTK2-specific widgets x11/libxfce4menu and x11/xfce4-conf.

| USES=       xfce:gtk2  |
| USE_XFCE= libmenu xfconf |

Xfce components included this way will automatically include any dependencies they need. It is no longer necessary to specify the entire list. If the port only needs x11-wm/xfce4-panel, use:

| USES=       xfce  |
| USE_XFCE= panel  |

There is no need to list the components x11-wm/xfce4-panel needs itself like this:

| USES=       xfce  |
| USE_XFCE= libexo libmenu libutil panel |

However, Xfce components and non-Xfce dependencies of the port must be included explicitly. Do not count on an Xfce component to provide a sub-dependency other than itself for the main port.
6.25. Using Databases

Use one of the `USES` macros from Database `USES Macros` to add a dependency on a database.

<table>
<thead>
<tr>
<th>Database</th>
<th><code>USES Macro</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Berkeley DB</td>
<td><code>bdb</code></td>
</tr>
<tr>
<td>MariaDB, MySQL, Percona</td>
<td><code>mysql</code></td>
</tr>
<tr>
<td>PostgreSQL</td>
<td><code>pgsql</code></td>
</tr>
<tr>
<td>SQLite</td>
<td><code>sqlite</code></td>
</tr>
</tbody>
</table>

**Example 89. Using Berkeley DB 6**

```plaintext
USES=   bdb:6
```

See `bdb` for more information.

**Example 90. Using MySQL**

When a port needs the MySQL client library add

```plaintext
USES=   mysql
```

See `mysql` for more information.

**Example 91. Using PostgreSQL**

When a port needs the PostgreSQL server version 9.6 or later add

```plaintext
USES=   pgsql:9.6+
WANT_PGSQL= server
```

See `pgsql` for more information.

**Example 92. Using SQLite 3**

```plaintext
USES=   sqlite:3
```

See `sqlite` for more information.
6.26. Starting and Stopping Services (rc Scripts)

rc.d scripts are used to start services on system startup, and to give administrators a standard way of stopping, starting and restarting the service. Ports integrate into the system rc.d framework. Details on its usage can be found in the rc.d Handbook chapter. Detailed explanation of the available commands is provided in rc(8) and rc.subr(8). Finally, there is an article on practical aspects of rc.d scripting.

With a mythical port called doorman, which needs to start a doormand daemon. Add the following to the Makefile:

```
USE_RC_SUBR= doormand
```

Multiple scripts may be listed and will be installed. Scripts must be placed in the files subdirectory and a .in suffix must be added to their filename. Standard SUB_LIST expansions will be ran against this file. Use of the %PREFIX% and %LOCALBASE% expansions is strongly encouraged as well. More on SUB_LIST in the relevant section.

As of FreeBSD 6.1-RELEASE, local rc.d scripts (including those installed by ports) are included in the overall rcorder(8) of the base system.

An example simple rc.d script to start the doormand daemon:
#!/bin/sh

# $FreeBSD$
#
# PROVIDE: doormand
# REQUIRE: LOGIN
# KEYWORD: shutdown
#
# Add these lines to /etc/rc.conf.local or /etc/rc.conf
# to enable this service:
#
# doormand_enable (bool): Set to NO by default.
# Set it to YES to enable doormand.
# doormand_config (path): Set to %PREFIX%/etc/doormand/doormand.cf
# by default.

. /etc/rc.subr

name=doormand
rcvar=doormand_enable

load_rc_config $name

: %{doormand_enable:="NO"}
: %{doormand_config="%PREFIX%/etc/doormand/doormand.cf"}

command=%PREFIX%/sbin/${name}
pidfile=/var/run/${name}.pid

command_args="-p $pidfile -f $doormand_config"

run_rc_command "$1"

Unless there is a very good reason to start the service earlier, or it runs as a particular user (other than root), all ports scripts must use:

REQUIRE: LOGIN

If the startup script launches a daemon that must be shutdown, the following will trigger a stop of the service on system shutdown:

KEYWORD: shutdown

If the script is not starting a persistent service this is not necessary.

For optional configuration elements the "=" style of default variable assignment is preferable to the ":=" style here, since the former sets a default value only if the variable is unset, and the latter sets
one if the variable is unset or null. A user might very well include something like:

doorand_flags=""

in their rc.conf.local, and a variable substitution using ":=" would inappropriately override the user’s intention. The _enable variable is not optional, and must use the ":" for the default.

Ports must not start and stop their services when installing and deinstalling. Do not abuse the plist keywords described in the @preexec command,@postexec command,@preunexec command,@postunexec command section by running commands that modify the currently running system, including starting or stopping services.

6.26.1. Pre-Commit Checklist

Before contributing a port with an rc.d script, and more importantly, before committing one, please consult this checklist to be sure that it is ready.

The devel/rclint port can check for most of these, but it is not a substitute for proper review.

1. If this is a new file, does it have a .sh extension? If so, that must be changed to just file.in since rc.d files may not end with that extension.

2. Does the file have a $FreeBSD$ tag?

3. Do the name of the file (minus .in), the PROVIDE line, and $ name all match? The file name matching PROVIDE makes debugging easier, especially for rcorder(8) issues. Matching the file name and `$ `name makes it easier to figure out which variables are relevant in rc.conf[.local]. It is also a policy for all new scripts, including those in the base system.

4. Is the REQUIRE line set to LOGIN? This is mandatory for scripts that run as a non-root user. If it runs as root, is there a good reason for it to run prior to LOGIN? If not, it must run after so that local scrips can be loosely grouped to a point in rcorder(8) after most everything in the base is already running.

5. Does the script start a persistent service? If so, it must have KEYWORD: shutdown.

6. Make sure there is no KEYWORD: FreeBSD present. This has not been necessary nor desirable for years. It is also an indication that the new script was copy/pasted from an old script, so extra caution must be given to the review.

7. If the script uses an interpreted language like perl, python, or ruby, make certain that command_interpreter is set appropriately, for example, for Perl, by adding PERL=${PERL} to SUB_LIST and using %%PERL%%. Otherwise,

```
# service name stop
```

will probably not work properly. See service(8) for more information.

8. Have all occurrences of /usr/local been replaced with %%PREFIX%%?
9. Do the default variable assignments come after `load_rc_config`?

10. Are there default assignments to empty strings? They should be removed, but double-check that the option is documented in the comments at the top of the file.

11. Are things that are set in variables actually used in the script?

12. Are options listed in the default `name` `_flags` things that are actually mandatory? If so, they must be in `command_args`. `-d` is a red flag (pardon the pun) here, since it is usually the option to "daemonize" the process, and therefore is actually mandatory.

13. `_name__flags` must never be included in `command_args` (and vice versa, although that error is less common).

14. Does the script execute any code unconditionally? This is frowned on. Usually these things must be dealt with through a `start_preced`.

15. All boolean tests must use the `checkyesno` function. No hand-rolled tests for `[Yy][Ee][Ss]`, etc.

16. If there is a loop (for example, waiting for something to start) does it have a counter to terminate the loop? We do not want the boot to be stuck forever if there is an error.

17. Does the script create files or directories that need specific permissions, for example, a pid that needs to be owned by the user that runs the process? Rather than the traditional `touch(1) /chown(8)/chmod(1)` routine, consider using `install(1)` with the proper command line arguments to do the whole procedure with one step.

### 6.27. Adding Users and Groups

Some ports require a particular user account to be present, usually for daemons that run as that user. For these ports, choose a unique UID from 50 to 999 and register it in `ports/UIDs` (for users) and `ports/GIDs` (for groups). The unique identification should be the same for users and groups.

Please include a patch against these two files when requiring a new user or group to be created for the port.

Then use `USERS` and `GROUPS` in Makefile, and the user will be automatically created when installing the port.

```
USERS=  pulse
GROUPS= pulse pulse-access pulse-rt
```

The current list of reserved UIDs and GIDs can be found in `ports/UIDs` and `ports/GIDs`.

### 6.28. Ports That Rely on Kernel Sources

Some ports (such as kernel loadable modules) need the kernel source files so that the port can compile. Here is the correct way to determine if the user has them installed:

```
USES=  kmod
```
Apart from this check, the kmod feature takes care of most items that these ports need to take into account.

6.29. Go Libraries

Ports must not package or install Go libs or source code. Go ports must fetch the required deps at the normal fetch time and should only install the programs and things users need, not the things Go developers would need.

Ports should (in order of preference):

- Use vendored dependencies included with the package source.
- Fetch the versions of deps specified by upstream (in the case of go.mod, vendor.json or similar).
- As a last resort (deps are not included nor versions specified exactly) fetch versions of dependencies available at the time of upstream development/release.

6.30. Haskell Libraries

Just like in case of Go language, Ports must not package or install Haskell libraries. Haskell ports must link statically to their dependencies and fetch all distribution files on fetch stage.

6.31. Shell Completion Files

Many modern shells (including bash, fish, tcsh and zsh) support parameter and/or option tab-completion. This support usually comes from completion files, which contain the definitions for how tab completion will work for a certain command. Ports sometimes ship with their own completion files, or porters may have created them themselves.

When available, completion files should always be installed. It is not necessary to make an option for it. If an option is used, though, always enable it in OPTIONS_DEFAULT.

<table>
<thead>
<tr>
<th>Shell</th>
<th>Completion File Paths</th>
</tr>
</thead>
<tbody>
<tr>
<td>bash</td>
<td>${PREFIX}/etc/bash_completion.d</td>
</tr>
<tr>
<td>fish</td>
<td>${PREFIX}/share/fish/vendor_completions.d</td>
</tr>
<tr>
<td>zsh</td>
<td>${PREFIX}/share/zsh/site-functions</td>
</tr>
</tbody>
</table>

Do not register any dependencies on the shells themselves.
Chapter 7. Flavors

7.1. An Introduction to Flavors

Flavors are a way to have multiple variations of a port. The port is built multiple times, with variations.

For example, a port can have a normal version with many features and quite a few dependencies, and a light "lite" version with only basic features and minimal dependencies.

Another example could be, a port can have a GTK flavor and a QT flavor, depending on which toolkit it uses.

7.2. Using FLAVORS

To declare a port having multiple flavors, add FLAVORS to its Makefile. The first flavor in FLAVORS is the default flavor.

It can help simplify the logic of the Makefile to also define FLAVOR as:

```
FLAVOR?=   ${FLAVORS:[1]}
```

To distinguish flavors from options, which are always uppercase letters, flavor names can only contain lowercase letters, numbers, and the underscore `_`.

Example 93. Basic Flavors Usage

If a port has a "lite" slave port, the slave port can be removed, and the port can be converted to flavors with:

```
FLAVORS=   default lite
lite_PKGNAMESUFFIX= -lite
[...]
.if ${FLAVOR:U} != lite
[enable non lite features]
.endif
```
If a port has a -nox11 slave port, the slave port can be removed, and the port can be converted to flavors with:

```bash
FLAVORS= x11 nox11
FLAVOR?= ${FLAVORS:1}
nox11_PKGNAMESUFFIX= -nox11
[...]
.if ${FLAVOR} == x11
[enable x11 features]
.endif
```
Here is a slightly edited excerpt of what is present in `devel/libpeas`, a port that uses the **Python flavors**. With the default Python 2 and 3 versions being 2.7 and 3.6, it will automatically get

```
FLAVORS=py27 py36
```

This port does not use `USE_PYTHON=distutils` but needs Python flavors anyway. To guard against `FLAVOR` being empty, which would cause a `make(1)` error, use `${FLAVOR:U}` in string comparisons instead of `${FLAVOR}`. The Gnome Python gobject3 bindings have two different names, one for Python 2, pygobject3 and one for Python 3, py3gobject3. The `configure` script has to run in `${WRKSRC}`, but we are only interested in building and installing the Python 2 or Python 3 parts of the software, so set the build and install base directories appropriately. Hint about the correct Python 3 config script path name. The packing list is different when the built with Python 3. As there are three possible Python 3 versions, set PLIST for all three using the `helper`.

### 7.2.1. Flavors Helpers

To make the Makefile easier to write, a few flavors helpers exist.

This list of helpers will set their variable:

- `_flavor_PKGNAMEPREFIX`
- `_flavor_PKGNAMEPREFIX`
- `_flavor_PKGNAMEUFFIX`
- `_flavor_PLIST`
This list of helpers will append to their variable:

- \_flavor\_DESCR
- \_flavor\_CONFLICTS
- \_flavor\_CONFLICTS\_BUILD
- \_flavor\_CONFLICTS\_INSTALL
- \_flavor\_PKG\_DEPENDS
- \_flavor\_EXTRACT\_DEPENDS
- \_flavor\_PATCH\_DEPENDS
- \_flavor\_FETCH\_DEPENDS
- \_flavor\_BUILD\_DEPENDS
- \_flavor\_LIB\_DEPENDS
- \_flavor\_RUN\_DEPENDS
- \_flavor\_TEST\_DEPENDS

例 96. Flavor Specific PKGNAME

As all packages must have a different package name, flavors must change theirs, using \_flavor\_PKGNAMESUFFIX and \_flavor\_PKGNAMESUFFIX makes this easy:

<table>
<thead>
<tr>
<th>FLAVORS=</th>
<th>normal lite</th>
</tr>
</thead>
<tbody>
<tr>
<td>lite_PKGNAMESUFFIX=</td>
<td>-lite</td>
</tr>
</tbody>
</table>

7.3. USES=php and Flavors

When using php with one of these arguments, phpize, ext, zend, or pecl, the port will automatically have FLAVORS filled in with the PHP versions it supports.
97. Simple USES=php Extension

This will generate package for all the supported versions:

```
PORTNAME=  some-ext
PORTVERSION=  0.0.1
PKGNAMEPREFIX=  ${PHP_PKGNAMEPREFIX}
USES=  php:ext
```

This will generate package for all the supported versions but 7.2:

```
PORTNAME=  some-ext
PORTVERSION=  0.0.1
PKGNAMEPREFIX=  ${PHP_PKGNAMEPREFIX}
USES=  php:ext
IGNORE_WITH_PHP=  72
```

7.3.1. PHP Flavors with PHP Applications

PHP applications can also be flavorized.

This allows generating packages for all PHP versions, so that users can use them with whatever version they need on their servers.

⚠️ PHP applications that are flavorized must append `PHP_PKGNAME_SUFFIX` to their package names.

98. Flavorizing a PHP Application

Adding Flavors support to a PHP application is straightforward:

```
PKGNAMESUFFIX=  ${PHP_PKGNAMESUFFIX}
USES=  php:flavors
```

💡 When adding a dependency on a PHP flavored port, use `@${PHP_FLAVOR}`. Never use `FLAVOR` directly.

7.4. USES=python and Flavors

When using `python` and `USE_PYTHON=distutils`, the port will automatically have `FLAVORS` filled in with the Python versions it supports.
Supposing the current Python supported versions are 2.7, 3.4, 3.5, and 3.6, and the default Python 2 and 3 versions are 2.7 and 3.6, a port with:

```
USES=   python
USE_PYTHON= distutils
```

Will get these flavors: `py27` and `py36`.

```
USES=   python
USE_PYTHON= distutils allflavors
```

Will get these flavors: `py27`, `py34`, `py35` and `py36`.

**Example 100. USES=python with Version Requirements**

Supposing the current Python supported versions are 2.7, 3.4, 3.5, and 3.6, and the default Python 2 and 3 versions are 2.7 and 3.6, a port with:

```
USES=   python:-3.5
USE_PYTHON= distutils
```

Will get this flavor: `py27`.

```
USES=   python:-3.5
USE_PYTHON= distutils allflavors
```

Will get these flavors: `py27`, `py34`, and `py35`.

```
USES=   python:3.4+
USE_PYTHON= distutils
```

Will get this flavor: `py36`.

```
USES=   python:3.4+
USE_PYTHON= distutils allflavors
```

Will get these flavors: `py34`, `py35`, and `py36`.

**PY_FLAVOR** is available to depend on the correct version of Python modules. All dependencies on flavored Python ports should use **PY_FLAVOR**, and not **FLAVOR** directly.
If the default Python 3 version is 3.6, the following will set `PY_FLAVOR` to `py36`:

```bash
RUN_DEPENDS= ${PYTHON_PKGNAMEPREFIX}mutagen>0:audio/py-mutagen@${PY_FLAVOR}
USES= python:3.5+
```

### 7.5. `USES=lua` and Flavors

When using `lua:module` or `lua:flavors`, the port will automatically have `FLAVORS` filled in with the Lua versions it supports. However, it is not expected that ordinary applications (rather than Lua modules) should use this feature; most applications that embed or otherwise use Lua should simply use `USES=lua`.

`LUA_FLAVOR` is available (and must be used) to depend on the correct version of dependencies regardless of whether the port used the `flavors` or `module` parameters.

See [Using Lua](#) for further information.
8.1. Changing pkg-plist Based on Make Variables

Some ports, particularly the p5- ports, need to change their pkg-plist depending on what options they are configured with (or version of perl, in the case of p5- ports). To make this easy, any instances in pkg-plist of %%OSREL%%, %%PERL_VER%%, and %%PERL_VERSION%% will be substituted appropriately. The value of %%OSREL%% is the numeric revision of the operating system (for example, 4.9). %%PERL_VERSION%% and %%PERL_VER%% is the full version number of perl (for example, 5.8.9). Several other %%VARS%% related to port’s documentation files are described in the relevant section.

To make other substitutions, set PLIST_SUB with a list of VAR=VALUE pairs and instances of %%VAR%% will be substituted with VALUE in pkg-plist.

For instance, if a port installs many files in a version-specific subdirectory, use a placeholder for the version so that pkg-plist does not have to be regenerated every time the port is updated. For example, set:

```
OCTAVE_VERSION= ${PORTREVISION}
PLIST_SUB=  OCTAVE_VERSION=${OCTAVE_VERSION}
```

in the Makefile and use %%OCTAVE_VERSION%% wherever the version shows up in pkg-plist. When the port is upgraded, it will not be necessary to edit dozens (or in some cases, hundreds) of lines in pkg-plist.

If files are installed conditionally on the options set in the port, the usual way of handling it is prefixing pkg-plist lines with a %%OPT%% for lines needed when the option is enabled, or %%NO_OPT%% when the option is disabled, and adding OPTIONS_SUB=yes to the Makefile. See OPTIONS_SUB for more information.

For instance, if there are files that are only installed when the X11 option is enabled, and Makefile has:

```
OPTIONS_DEFINE= X11
OPTIONS_SUB=    yes
```

In pkg-plist, put %%X11%% in front of the lines only being installed when the option is enabled, like this:

```
%%X11%%bin/foo-gui
```

This substitution will be done between the pre-install and do-install targets, by reading from PLIST and writing to TMPPLIST (default: WRKDIR/.PLIST.mktmp). So if the port builds PLIST on the fly, do so in or before pre-install. Also, if the port needs to edit the resulting file, do so in post-install to a file named TMPPLIST.
Another way of modifying a port’s packing list is based on setting the variables `PLIST_FILES` and `PLIST_DIRS`. The value of each variable is regarded as a list of pathnames to write to TMPPLIST along with PLIST contents. While names listed in `PLIST_FILES` and `PLIST_DIRS` are subject to `%%VAR%%` substitution as described above, it is better to use the `${VAR}` directly. Except for that, names from `PLIST_FILES` will appear in the final packing list unchanged, while `@dir` will be prepended to names from `PLIST_DIRS`. To take effect, `PLIST_FILES` and `PLIST_DIRS` must be set before TMPPLIST is written, that is, in `pre-install` or earlier.

From time to time, using `OPTIONS_SUB` is not enough. In those cases, adding a specific `TAG` to `PLIST_SUB` inside the Makefile with a special value of `@comment`, makes package tools to ignore the line. For instance, if some files are only installed when the `X11` option is on and the architecture is `i386`:

```makefile
.include <bsd.port.pre.mk>

.if ${PORT_OPTIONS:MX11} && ${ARCH} == "i386"
PLIST_SUB+= X11I386=""
.else
PLIST_SUB+= X11I386="@comment "
.endif
```

### 8.2. Empty Directories

#### 8.2.1. Cleaning Up Empty Directories

When being de-installed, a port has to remove empty directories it created. Most of these directories are removed automatically by `pkg(8)`, but for directories created outside of `${PREFIX}`, or empty directories, some more work needs to be done. This is usually accomplished by adding `@dir` lines for those directories. Subdirectories must be deleted before deleting parent directories.

```makefile
[...]
@dir /var/games/oneko/saved-games
@dir /var/games/oneko
```

#### 8.2.2. Creating Empty Directories

Empty directories created during port installation need special attention. They must be present when the package is created. If they are not created by the port code, create them in the Makefile:

```
post-install:
  ${MKDIR} ${STAGEDIR}${PREFIX}/some/directory
```

Add the directory to `pkg-plist` like any other. For example:

```makefile
@dir some/directory
```
8.3. Configuration Files

If the port installs configuration files to PREFIX/etc (or elsewhere) do not list them in pkg-plist. That will cause pkg delete to remove files that have been carefully edited by the user, and a re-installation will wipe them out.

Instead, install sample files with a filename.sample extension. The @sample macro automates this, see @sample file [file] for what it does exactly. For each sample file, add a line to pkg-plist:

```
@sample etc/orbit.conf.sample
```

If there is a very good reason not to install a working configuration file by default, only list the sample filename in pkg-plist, without the @sample followed by a space part, and add a message pointing out that the user must copy and edit the file before the software will work.

When a port installs its configuration in a subdirectory of ${PREFIX}/etc, use ETCDIR, which defaults to ${PREFIX}/etc/${PORTNAME}, it can be overridden in the ports Makefile if there is a convention for the port to use some other directory. The %ETCDIR% macro will be used in its stead in pkg-plist.

The sample configuration files should always have the .sample suffix. If for some historical reason using the standard suffix is not possible, or if the sample files come from some other directory, use this construct:

```
@sample etc/orbit.conf-dist etc/orbit.conf
```

or

```
@sample %%EXAMPLESDIR%%/orbit.conf etc/orbit.conf
```

The format is @sample sample-file actual-config-file.

8.4. Dynamic Versus Static Package List

A static package list is a package list which is available in the Ports Collection either as pkg-plist (with or without variable substitution), or embedded into the Makefile via PLIST_FILES and PLIST_DIRS. Even if the contents are auto-generated by a tool or a target in the Makefile before the inclusion into the Ports Collection by a committer (for example, using make makeplist), this is still considered a static list, since it is possible to examine it without having to download or compile the distfile.

A dynamic package list is a package list which is generated at the time the port is compiled based upon the files and directories which are installed. It is not possible to examine it before the source code of the ported application is downloaded and compiled, or after running a make clean.
While the use of dynamic package lists is not forbidden, maintainers should use static package lists wherever possible, as it enables users to `grep(1)` through available ports to discover, for example, which port installs a certain file. Dynamic lists should be primarily used for complex ports where the package list changes drastically based upon optional features of the port (and thus maintaining a static package list is infeasible), or ports which change the package list based upon the version of dependent software used. For example, ports which generate docs with Javadoc.

### 8.5. Automated Package List Creation

First, make sure the port is almost complete, with only `pkg-plist` missing. Running `make makeplist` will show an example for `pkg-plist`. The output of `makeplist` must be double checked for correctness as it tries to automatically guess a few things, and can get it wrong.

User configuration files should be installed as `filename.sample`, as it is described in Configuration Files. `info/dir` must not be listed and appropriate `install-info` lines must be added as noted in the info files section. Any libraries installed by the port must be listed as specified in the shared libraries section.

#### 8.5.1. Expanding `PLIST_SUB` with Regular Expressions

Strings to be replaced sometimes need to be very specific to avoid undesired replacements. This is a common problem with shorter values.

To address this problem, for each `PLACEHOLDER=value`, a `PLACEHOLDER_regex=regex` can be set, with the `regex` part matching `value` more precisely.
Perl ports can install architecture dependent files in a specific tree. On FreeBSD to ease porting, this tree is called *mach*. For example, a port that installs a file whose path contains *mach* could have that part of the path string replaced with the wrong values. Consider this Makefile:

```makefile
PORTNAME= Machine-Build
DISTVERSION= 1
CATEGORIES= devel perl5
MASTER_SITES= CPAN
PKGNAMEPREFIX= p5-
MAINTAINER= perl@FreeBSD.org
COMMENT= Building machine
USES= perl5
USE_PERL5= configure

PLIST_SUB= PERL_ARCH=mach
```

The files installed by the port are:

```
/usr/local/bin/machine-build
/usr/local/lib/perl5/site_perl/man/man1/machine-build.1.gz
/usr/local/lib/perl5/site_perl/man/man3/Machine::Build.3.gz
/usr/local/lib/perl5/site_perl/Machine/Build.pm
/usr/local/lib/perl5/site_perl/mach/5.20/Machine/Build/Build.so
```

Running `make makeplist` wrongly generates:

```
bin/%%PERL_ARCH%%ine-build
%%PERL5_MAN1%%/%%PERL_ARCH%%ine-build.1.gz
%%PERL5_MAN3%%/Machine::Build.3.gz
%%SITE_PERL%%/Machine/Build.pm
%%SITE_PERL%%/%%PERL_ARCH%%%/%%PERL_VER%%/Machine/Build/Build.so
```

Change the `PLIST_SUB` line from the Makefile to:

```makefile
PLIST_SUB= PERL_ARCH=mach \  
         PERL_ARCH_regex=\b mach \b
```

Now `make makeplist` correctly generates:
8.6. Expanding Package List with Keywords

All keywords can also take optional arguments in parentheses. The arguments are owner, group, and mode. This argument is used on the file or directory referenced. To change the owner, group, and mode of a configuration file, use:

```
@sample(games,games,640) etc/config.sample
```

The arguments are optional. If only the group and mode need to be changed, use:

```
@sample(,games,660) etc/config.sample
```

If a keyword is used on an optional entry, it must to be added after the helper:

```
%%FOO%%@sample etc/orbit.conf.sample
```

This is because the options plist helpers are used to comment out the line, so they need to be put first. See OPTIONS_SUB for more information.

8.6.1. @desktop-file-utils

Will run `update-desktop-database -q` after installation and deinstallation. *Never* use directly, add USES=desktop-file-utils to the Makefile.

8.6.2. @fc directory

Add a @dir entry for the directory passed as an argument, and run fc-cache -fs on that directory after installation and deinstallation.

8.6.3. @fcfontsdir directory

Add a @dir entry for the directory passed as an argument, and run fc-cache -fs, mkfontscale and mkfontdir on that directory after installation and deinstallation. Additionally, on deinstallation, it removes the fonts.scale and fonts.dir cache files if they are empty. This keyword is equivalent to adding both @fc directory and @fontsdir directory.
8.6.4. @fontsdir directory
Add a @dir entry for the directory passed as an argument, and run mkfontscale and mkfontdir on that directory after installation and deinstallation. Additionally, on deinstallation, it removes the fonts.scale and fonts.dir cache files if they are empty.

8.6.5. @glib-schemas
Runs glib-compile-schemas on installation and deinstallation.

8.6.6. @info file
Add the file passed as argument to the plist, and updates the info document index on installation and deinstallation. Additionally, it removes the index if empty on deinstallation. This should never be used manually, but always through INFO. See Info Files for more information.

8.6.7. @kld directory
Runs kldxref on the directory on installation and deinstallation. Additionally, on deinstallation, it will remove the directory if empty.

8.6.8. @rmtry file
Will remove the file on deinstallation, and not give an error if the file is not there.

8.6.9. @sample file [file]
This is used to handle installation of configuration files, through example files bundled with the package. The "actual", non-sample, file is either the second filename, if present, or the first filename without the .sample extension.

This does three things. First, add the first file passed as argument, the sample file, to the plist. Then, on installation, if the actual file is not found, copy the sample file to the actual file. And finally, on deinstallation, remove the actual file if it has not been modified. See Configuration Files for more information.

8.6.10. @shared-mime-info directory
Runs update-mime-database on the directory on installation and deinstallation.

8.6.11. @shell file
Add the file passed as argument to the plist.

On installation, add the full path to file to /etc/shells, while making sure it is not added twice. On deinstallation, remove it from /etc/shells.
8.6.12. **@terminfo**

Do not use by itself. If the port installs *.terminfo* files, add to its Makefile.

On installation and deinstallation, if *tic* is present, refresh *(PREFIX)/shared/misc/terminfo.db* from the *.terminfo* files in *(PREFIX)/shared/misc*.

8.6.13. **Base Keywords**

There are a few keywords that are hardcoded, and documented in *pkg-create*(8). For the sake of completeness, they are also documented here.

8.6.13.1. **@ [file]**

The empty keyword is a placeholder to use when the file's owner, group, or mode need to be changed. For example, to set the group of the file to *games* and add the setgid bit, add:

```
@,(games,2755) sbin/daemon
```

8.6.13.2. **@preexec command, @postexec command, @preunexec command, @postunexec command**

Execute *command* as part of the package installation or deinstallation process.

- **@preexec command**
  
  Execute *command* as part of the pre-install scripts.

- **@postexec command**
  
  Execute *command* as part of the post-install scripts.

- **@preunexec command**
  
  Execute *command* as part of the pre-deinstall scripts.

- **@postunexec command**
  
  Execute *command* as part of the post-deinstall scripts.

If *command* contains any of these sequences somewhere in it, they are expanded inline. For these examples, assume that *@cwd* is set to /usr/local and the last extracted file was bin/emacs.

- **%F**
  
  Expand to the last filename extracted (as specified). In the example case bin/emacs.

- **%D**
  
  Expand to the current directory prefix, as set with *@cwd*. In the example case /usr/local.

- **%B**
  
  Expand to the basename of the fully qualified filename, that is, the current directory prefix plus the last filespec, minus the trailing filename. In the example case, that would be /usr/local/bin.
Expand to the filename part of the fully qualified name, or the converse of \%B. In the example case, emacs.

These keywords are here to help you set up the package so that it is as ready to use as possible. They must not be abused to start services, stop services, or run any other commands that will modify the currently running system.

8.6.13.3. \@mode mode

Set default permission for all subsequently extracted files to mode. Format is the same as that used by chmod(1). Use without an arg to set back to default permissions (mode of the file while being packed).

This must be a numeric mode, like 644, 4755, or 600. It cannot be a relative mode like u+s.

8.6.13.4. \@owner user

Set default ownership for all subsequent files to user. Use without an argument to set back to default ownership (root).

8.6.13.5. \@group group

Set default group ownership for all subsequent files to group. Use without an arg to set back to default group ownership (wheel).

8.6.13.6. \@comment string

This line is ignored when packing.

8.6.13.7. \@dir directory

Declare directory name. By default, directories created under PREFIX by a package installation are automatically removed. Use this when an empty directory under PREFIX needs to be created, or when the directory needs to have non default owner, group, or mode. Directories outside of PREFIX need to be registered. For example, /var/db/\{PORTNAME\} needs to have a \@dir entry whereas \{PREFIX\}/shared/\{PORTNAME\} does not if it contains files or uses the default owner, group, and mode.

8.6.13.8. \@exec command, \@unexec command (Deprecated)

Execute command as part of the installation or deinstallation process. Please use \@preexec command, \@postexec command, \@preunexec command, @postunexec command instead.

8.6.13.9. \@dirrm directory (Deprecated)

Declare directory name to be deleted at deinstall time. By default, directories created under PREFIX by a package installation are deleted when the package is deinstalled.
8.6.13.10. **@dirrmtry directory (Deprecated)**

Declare directory name to be removed, as for @dirrm, but does not issue a warning if the directory cannot be removed.

8.6.14. Creating New Keywords

Package list files can be extended by keywords that are defined in the ${PORTSDIR}/Keywords directory. The settings for each keyword are stored in a UCL file named keyword.ucl. The file must contain at least one of these sections:

- **attributes**
- **action**
- **pre-install**
- **post-install**
- **pre-deinstall**
- **post-deinstall**
- **pre-upgrade**
- **post-upgrade**

8.6.14.1. **attributes**

Changes the owner, group, or mode used by the keyword. Contains an associative array where the possible keys are `owner`, `group`, and `mode`. The values are, respectively, a user name, a group name, and a file mode. For example:

```
attributes: { owner: "games", group: "games", mode: 0555 }
```

8.6.14.2. **action**

Defines what happens to the keyword’s parameter. Contains an array where the possible values are:

- **setprefix**
  - Set the prefix for the next plist entries.

- **dir**
  - Register a directory to be created on install and removed on deinstall.

- **dirrm**
  - Register a directory to be deleted on deinstall. Deprecated.

- **dirrmtry**
  - Register a directory to try and deleted on deinstall. Deprecated.
file
   Register a file.

setmode
   Set the mode for the next plist entries.

setowner
   Set the owner for the next plist entries.

setgroup
   Set the group for the next plist entries.

comment
   Does not do anything, equivalent to not entering an action section.

ignore_next
   Ignore the next entry in the plist.

8.6.14.3. arguments

If set to true, adds argument handling, splitting the whole line, %0, into numbered arguments, %1, %2, and so on. For example, for this line:

@foo some.content other.content

%1 and %2 will contain:

   some.content
   other.content

It also affects how the action entry works. When there is more than one argument, the argument number must be specified. For example:

actions: [file(1)]

8.6.14.4. pre-install, post-install, pre-deinstall, post-deinstall, pre-upgrade, post-upgrade

These keywords contains a sh(1) script to be executed before or after installation, deinstallation, or upgrade of the package. In addition to the usual @exec %foo placeholders described in @preexec command, @postexec command, @preunexec command, @postunexec command, there is a new one, %0, which represents the argument of the keyword.

8.6.14.5. Custom Keyword Examples
Example of a @dirrmtryecho Keyword

This keyword does two things, it adds a @dirrmtry directory line to the packing list, and echoes the fact that the directory is removed when deinstalling the package.

```
actions: [dirrmtry]
post-deinstall: <<EOD
  echo "Directory %D/%@ removed."
EOD
```
例 104. Real Life Example, How @sample is Implemented

This keyword does three things. It adds the first filename passed as an argument to @sample to the packing list, it adds to the post-install script instructions to copy the sample to the actual configuration file if it does not already exist, and it adds to the post-deinstall instructions to remove the configuration file if it has not been modified.
actions: [file(1)]
arguments: true
post-install: <<EOD
 case "%1" in
 /*) sample_file="%1" ;
 *) sample_file="%D/%1" ;
 esac
 target_file="${sample_file%.sample}"
 set -- @
 if [ $# -eq 2 ]; then
  target_file=${2}
 fi
 case "${target_file}" in
 /*) target_file="${target_file}" ;
 *) target_file="%D/${target_file}" ;
 esac
 if ! [ -f "${target_file}" ]; then
  /bin/cp -p "${sample_file}" "${target_file}" && 
  /bin/chmod u+w "${target_file}"
 fi
 EOD
pre-deinstall: <<EOD
 case "%1" in
 /*) sample_file="%1" ;
 *) sample_file="%D/%1" ;
 esac
 target_file="${sample_file%.sample}"
 set -- @
 if [ $# -eq 2 ]; then
  set -- @
  target_file=${2}
 fi
 case "${target_file}" in
 /*) target_file="${target_file}" ;
 *) target_file="%D/${target_file}" ;
 esac
 if cmp -s "${target_file}" "${sample_file}"; then
  rm -f "${target_file}"
 else
  echo "You may need to manually remove ${target_file} if it is no longer
 needed."
 fi
 EOD
Chapter 9. pkg-*

There are some tricks we have not mentioned yet about the pkg-* files that come in handy sometimes.

9.1. pkg-message

To display a message when the package is installed, place the message in pkg-message. This capability is often useful to display additional installation steps to be taken after a pkg install or pkg upgrade.

- pkg-message must contain only information that is vital to setup and operation on FreeBSD, and that is unique to the port in question.
- Setup information should only be shown on initial install. Upgrade instructions should be shown only when upgrading from the relevant version.
- Do not surround the messages with either whitespace or lines of symbols (like ---------, or =========). Leave the formatting to pkg(8).
- Committers have blanket approval to constrain existing messages to install or upgrade ranges using the UCL format specifications.

pkg-message supports two formats:

raw

A regular plain text file. Its message is only displayed on install.

UCL

If the file starts with “[” then it is considered to be a UCL file. The UCL format is described on libucl's GitHub page.

Do not add an entry for pkg-message in pkg-plist.

9.1.1. UCL in pkg-message

The format is the following. It should be an array of objects. The objects themselves can have these keywords:

message

The actual message to be displayed. This keyword is mandatory.

type

When the message should be displayed.

maximum_version

Only if type is upgrade. Display if upgrading from a version strictly lower than the version specified.
**minimum_version**

Only if **type** is **upgrade**. Display if upgrading from a version strictly greater than the version specified.

The **maximum_version** and **minimum_version** keywords can be combined.

The **type** keyword can have three values:

**install**

The message should only be displayed when the package is installed.

**remove**

The message should only be displayed when the package is removed.

**upgrade**

The message should only be displayed during an upgrade of the package.

⚠️ To preserve the compatibility with non UCL pkg-message files, the first line of a UCL pkg-message **MUST be** a single “[”, and the last line **MUST be** a single “]”.

**Example 105. UCL Short Strings**

The message is delimited by double quotes "", this is used for simple single line strings:

```
[
    { type: install
        message: "Simple message"
    }
]
```

**Example 106. UCL Multiline Strings**

Multiline strings use the standard here document notation. The multiline delimiter **must** start just after `<<` symbols without any whitespace and it **must** consist of capital letters only. To finish a multiline string, add the delimiter string on a line of its own without any whitespace. The message from UCL Short Strings can be written as:

```
[
    { type: install
        message: <<EOM
            Simple message
        EOM
    }
]
```
107. Display a Message on Install/Deinstall

When a message only needs to be displayed on installation or uninstallation, set the type:

```
[
    { type: remove
        message: "package being removed."
    }
    { type: install, message: "package being installed."}
]
```

108. Display a Message on Upgrade

When a port is upgraded, the message displayed can be even more tailored to the port's needs.

```
[
    { type: upgrade
        message: "Package is being upgraded."
    }
    { type: upgrade
        maximum_version: "1.0"
        message: "Upgrading from before 1.0 need to do this."
    }
    { type: upgrade
        minimum_version: "1.0"
        message: "Upgrading from after 1.0 should do that."
    }
    { type: upgrade
        maximum_version: "3.0"
        minimum_version: "1.0"
        message: "Upgrading from > 1.0 and < 3.0 remove that file."
    }
]
```

When displaying a message on upgrade, it is important to limit when it is being shown to the user. Most of the time it is by using `maximum_version` to limit its usage to upgrades from before a certain version when something specific needs to be done.
9.2. pkg-install

If the port needs to execute commands when the binary package is installed with `pkg add` or `pkg install`, use pkg-install. This script will automatically be added to the package. It will be run twice by `pkg`, the first time as `$(SH) pkg-install $(PKGNAME) PRE-INSTALL` before the package is installed, and the second time as `$(SH) pkg-install $(PKGNAME) POST-INSTALL` after it has been installed. `$2` can be tested to determine which mode the script is being run in. The `PKG_PREFIX` environmental variable will be set to the package installation directory.

This script is here to help you set up the package so that it is as ready to use as possible. It must not be abused to start services, stop services, or run any other commands that will modify the currently running system.

9.3. pkg-deinstall

This script executes when a package is removed.

This script will be run twice by `pkg delete`. The first time as `$(SH) pkg-deinstall $(PKGNAME) DEINSTALL` before the port is de-installed and the second time as `$(SH) pkg-deinstall $(PKGNAME) POST-DEINSTALL` after the port has been de-installed. `$2` can be tested to determine which mode the script is being run in. The `PKG_PREFIX` environmental variable will be set to the package installation directory.

This script is here to help you set up the package so that it is as ready to use as possible. It must not be abused to start services, stop services, or run any other commands that will modify the currently running system.

9.4. Changing the Names of pkg-*

All the names of pkg-* are defined using variables that can be changed in the Makefile if needed. This is especially useful when sharing the same pkg-* files among several ports or when it is necessary to write to one of these files. See writing to places other than `WRKDIR` for why it is a bad idea to write directly into the directory containing the pkg-* files.

Here is a list of variable names and their default values. (`PKGDIR` defaults to `${MASTERDIR}`.)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESCR</td>
<td><code>${PKGDIR}/pkg-descr</code></td>
</tr>
<tr>
<td>PLIST</td>
<td><code>${PKGDIR}/pkg-plist</code></td>
</tr>
<tr>
<td>PKGINSTALL</td>
<td><code>${PKGDIR}/pkg-install</code></td>
</tr>
<tr>
<td>PKGDEINSTALL</td>
<td><code>${PKGDIR}/pkg-deinstall</code></td>
</tr>
<tr>
<td>PKGMESSAGE</td>
<td><code>${PKGDIR}/pkg-message</code></td>
</tr>
</tbody>
</table>
9.5. Making Use of SUB_FILES and SUB_LIST

SUB_FILES and SUB_LIST are useful for dynamic values in port files, such as the installation PREFIX in pkg-message.

SUB_FILES specifies a list of files to be automatically modified. Each file in the SUB_FILES list must have a corresponding file.in present in FILESDIR. A modified version will be created as ${WRKDIR}/file. Files defined as a value of USE_RC_SUBR are automatically added to SUB_FILES. For the files pkg-message, pkg-install, and pkg-deinstall, the corresponding Makefile variable is automatically set to point to the processed version.

SUB_LIST is a list of VAR=VALUE pairs. For each pair, %%VAR%% will be replaced with VALUE in each file listed in SUB_FILES. Several common pairs are automatically defined: PREFIX, LOCALBASE, DATADIR, DOCSDIR, EXAMPLESDIR, WWWDIR, and ETCDIR. Any line beginning with @comment followed by a space, will be deleted from resulting files after a variable substitution.

This example replaces %%ARCH%% with the system architecture in a pkg-message:

```
SUB_FILES=  pkg-message
SUB_LIST=   ARCH=${ARCH}
```

Note that for this example, pkg-message.in must exist in FILESDIR.

Example of a good pkg-message.in:

```
Now it is time to configure this package.
Copy %PREFIX%/shared/examples/putsy/%%ARCH%%.conf into your home directory as .putsy.conf and edit it.
```
Chapter 10. Testing the Port

10.1. Running `make describe`

Several of the FreeBSD port maintenance tools, such as `portupgrade(1)`, rely on a database called `/usr/ports/INDEX` which keeps track of such items as port dependencies. INDEX is created by the top-level ports/Makefile via `make index`, which descends into each port subdirectory and executes `make describe` there. Thus, if `make describe` fails in any port, no one can generate INDEX, and many people will quickly become unhappy.

It is important to be able to generate this file no matter what options are present in `make.conf`, so please avoid doing things such as using `.error` statements when (for instance) a dependency is not satisfied. (See Avoid Use of the `.error Construct`.)

If `make describe` produces a string rather than an error message, everything is probably safe. See `bsd.port.mk` for the meaning of the string produced.

Also note that running a recent version of `portlint` (as specified in the next section) will cause `make describe` to be run automatically.

10.2. Portclippy / Portfmt

Those tools come from `ports-mgmt/portfmt`.

Portclippy is a linter that checks if variables in the `Makefile` are in the correct order according to Order of Variables in Port Makefiles.

Portfmt is a tool for automatically formatting `Makefile`.

10.3. Portlint

Do check the port with `portlint` before submitting or committing it. `portlint` warns about many common errors, both functional and stylistic. For a new (or repocopied) port, `portlint -A` is the most thorough; for an existing port, `portlint -C` is sufficient.

Since `portlint` uses heuristics to try to figure out errors, it can produce false positive warnings. In addition, occasionally something that is flagged as a problem really cannot be done in any other way due to limitations in the ports framework. When in doubt, the best thing to do is ask on FreeBSD ports 郵·論壇.

10.4. Port Tools

The `ports-mgmt/porttools` program is part of the Ports Collection.

`port` is the front-end script, which can help simplify the testing job. Whenever a new port or an update to an existing one needs testing, use `port test` to test the port, including the `portlint` checking. This command also detects and lists any files that are not listed in pkg-plist. For example:
10.5. **PREFIX and DESTDIR**

**PREFIX** determines where the port will be installed. It defaults to /usr/local, but can be set by the user to a custom path like /opt. The port must respect the value of this variable.

**DESTDIR**, if set by the user, determines the complete alternative environment, usually a jail or an installed system mounted somewhere other than /. A port will actually install into DESTDIR/PREFIX, and register with the package database in DESTDIR/var/db/pkg. **DESTDIR** is handled automatically by the ports infrastructure with chroot(8). There is no need for modifications or any extra care to write DESTDIR-compliant ports.

The value of **PREFIX** will be set to **LOCALBASE** (defaulting to /usr/local). If **USE_LINUX_PREFIX** is set, **PREFIX** will be **LINUXBASE** (defaulting to /compat/linux).

Avoiding hard-coded /usr/local paths in the source makes the port much more flexible and able to cater to the needs of other sites. Often, this can be accomplished by replacing occurrences of /usr/local in the port's various Makefiles with \( $(PREFIX) \). This variable is automatically passed down to every stage of the build and install processes.

Make sure the application is not installing things in /usr/local instead of **PREFIX**. A quick test for such hard-coded paths is:

```
% make clean; make package PREFIX=/var/tmp/'make -V PORTNAME`
```

If anything is installed outside of **PREFIX**, the package creation process will complain that it cannot find the files.

In addition, it is worth checking the same with the stage directory support (see Staging):

```
% make stage && make check-plist && make stage-qa && make package
```

- **check-plist** checks for files missing from the plist, and files in the plist that are not installed by the port.
- **stage-qa** checks for common problems like bad shebang, symlinks pointing outside the stage directory, setuid files, and non-stripped libraries...

These tests will not find hard-coded paths inside the port's files, nor will it verify that **LOCALBASE** is being used to correctly refer to files from other ports. The temporarily-installed port in /var/tmp/`make -V PORTNAME` must be tested for proper operation to make sure there are no problems with paths.

**PREFIX** must not be set explicitly in a port's Makefile. Users installing the port may have set **PREFIX** to a custom location, and the port must respect that setting.
Refer to programs and files from other ports with the variables mentioned above, not explicit pathnames. For instance, if the port requires a macro `PAGER` to have the full pathname of `less`, do not use a literal path of `/usr/local/bin/less`. Instead, use `${LOCALBASE}`:

```
-DPAGER="${LOCALBASE}/bin/less"
```

The path with `LOCALBASE` is more likely to still work if the system administrator has moved the whole `/usr/local` tree somewhere else.

All these tests are done automatically when running `poudriere testport` or `poudriere bulk -t`. It is highly recommended that every ports contributor install and test their ports with it. See `Poudriere` for more information.

### 10.6. Poudriere

For a ports contributor, Poudriere is one of the most important and helpful testing and build tools. Its main features include:

- Bulk building of the entire ports tree, specific subsets of the ports tree, or a single port including its dependencies
- Automatic packaging of build results
- Generation of build log files per port
- Providing a signed `pkg(8)` repository
- Testing of port builds before submitting a patch to the FreeBSD bug tracker or committing to the ports tree
- Testing for successful ports builds using different options

Because Poudriere performs its building in a clean `jail(8)` environment and uses `zfs(8)` features, it has several advantages over traditional testing on the host system:

- No pollution of the host environment: No leftover files, no accidental removals, no changes of existing configuration files.
- Verify `pkg-plist` for missing or superfluous entries
- Ports committers sometimes ask for a Poudriere log alongside a patch submission to assess whether the patch is ready for integration into the ports tree

It is also quite straightforward to set up and use, has no dependencies, and will run on any supported FreeBSD release. This section shows how to install, configure, and run Poudriere as part of the normal workflow of a ports contributor.

The examples in this section show a default file layout, as standard in FreeBSD. Substitute any local changes accordingly. The ports tree, represented by `${PORTSDIR}`, is located in `/usr/ports`. Both `${LOCALBASE}` and `${PREFIX}` are `/usr/local` by default.
10.6.1. Installing Poudriere

Poudriere is available in the ports tree in `ports-mgmt/poudriere`. It can be installed using `pkg(8)` or from ports:

```
# pkg install poudriere
```

or

```
# make -C /usr/ports/ports-mgmt/poudriere install clean
```

There is also a work-in-progress version of Poudriere which will eventually become the next release. It is available in `ports-mgmt/poudriere-devel`. This development version is used for the official FreeBSD package builds, so it is well tested. It often has newer interesting features. A ports committer will want to use the development version because it is what is used in production, and has all the new features that will make sure everything is exactly right. A contributor will not necessarily need those as the most important fixes are backported to released version. The main reason for the use of the development version to build the official package is because it is faster, in a way that will shorten a full build from 18 hours to 17 hours when using a high end 32 CPU server with 128GB of RAM. Those optimizations will not matter a lot when building ports on a desktop machine.

10.6.2. Setting Up Poudriere

The port installs a default configuration file, `/usr/local/etc/poudriere.conf`. Each parameter is documented in the configuration file and in `poudriere(8)`. Here is a minimal example config file:

```
ZPOOL=tank
ZROOTFS=/poudriere
BASEFS=/poudriere
DISTFILES_CACHE=/usr/ports/distfiles
RESOLV_CONF=/etc/resolv.conf
FREEBSD_HOST=ftp://ftp.freebsd.org
SVN_HOST=svn.FreeBSD.org
```

**ZPOOL**

The name of the ZFS storage pool which Poudriere shall use. Must be listed in the output of `zpool status`.

**ZROOTFS**

The root of Poudriere-managed file systems. This entry will cause Poudriere to create `zfs(8)` file systems under `tank/poudriere`.

**BASEFS**

The root mount point for Poudriere file systems. This entry will cause Poudriere to mount `tank/poudriere` to `/poudriere`.
DISTFILES_CACHE
Defines where distfiles are stored. In this example, Poudriere and the host share the distfiles storage directory. This avoids downloading tarballs which are already present on the system. Please create this directory if it does not already exist so that Poudriere can find it.

RESOLV_CONF
Use the host /etc/resolv.conf inside jails for DNS. This is needed so jails can resolve the URLs of distfiles when downloading. It is not needed when using a proxy. Refer to the default configuration file for proxy configuration.

FREEBSD_HOST
The FTP/HTTP server to use when the jails are installed from FreeBSD releases and updated with freebsd-update(8). Choose a server location which is close, for example if the machine is located in Australia, use ftp.au.freebsd.org.

SVN_HOST
The server from where jails are installed and updated when using Subversion. Also used for ports tree when not using portsnap(8). Again, choose a nearby location. A list of official Subversion mirrors can be found in the FreeBSD Handbook Subversion section.

10.6.3. Creating Poudriere Jails
Create the base jails which Poudriere will use for building:

# poudriere jail -c -j 114Ramd64 -v 11.4-RELEASE -a amd64

Fetch a 11.4-RELEASE for amd64 from the FTP server given by FREEBSD_HOST in poudriere.conf, create the zfs file system tank/poudriere/jails/114Ramd64, mount it on /poudriere/jails/114Ramd64 and extract the 11.4-RELEASE tarballs into this file system.

# poudriere jail -c -j 11i386 -v stable/11 -a i386 -m git+https

Create tank/poudriere/jails/11i386, mount it on /poudriere/jails/11i386, then check out the tip of the Subversion branch of FreeBSD-11-STABLE from SVN_HOST in poudriere.conf into /poudriere/jails/11i386/usr/src, then complete a buildworld and install it into /poudriere/jails/11i386.

If a specific Subversion revision is needed, append it to the version string. For example:

# poudriere jail -c -j 11i386 -v stable/11@123456 -a i386 -m git+https

While it is possible to build a newer version of FreeBSD on an older version, most of the time it will not run. For example, if a stable/11 jail is needed, the host will have to run stable/11 too. Running 11.4-RELEASE is not enough.
To create a Poudriere jail for 14.0-CURRENT:

```bash
# poudriere jail -c -j 14amd64 -v main -a amd64 -m git+https
```

In order to run a 14.0-CURRENT Poudriere jail you must be running 14.0-CURRENT. In general, newer kernels can build and run older jails. For instance, a 14.0-CURRENT kernel can build and run a 11.4-STABLE. Poudriere jail if the COMPAT_FREEBSD11 kernel option was compiled in (on by default in 14.0-CURRENT GENERIC kernel config).

The default svn protocol works but is not very secure. Using svn+https along with verifying the remote server’s SSL fingerprint is advised. It will ensure that the files used for building the jail are from a trusted source.

A list of jails currently known to Poudriere can be shown with `poudriere jail -l`:

```
# poudriere jail -l
JAILNAME             VERSION              ARCH    METHOD
114Ramd64            11.4-RELEASE         amd64   ftp
11i386               11.4-STABLE          i386    svn+https
```

**10.6.4. Keeping Poudriere Jails Updated**

Managing updates is very straightforward. The command:

```
# poudriere jail -u -j JAILNAME
```

updates the specified jail to the latest version available. For FreeBSD releases, update to the latest patchlevel with `freebsd-update(8)`. For FreeBSD versions built from source, update to the latest Subversion revision in the branch.

For jails employing a `git+*` method, it is helpful to add `-J NumberOfParallelBuildJobs` to speed up the build by increasing the number of parallel compile jobs used. For example, if the building machine has 6 CPUs, use:

```
# poudriere jail -u -J 6 -j JAILNAME
```

**10.6.5. Setting Up Ports Trees for Use with Poudriere**

There are multiple ways to use ports trees in Poudriere. The most straightforward way is to have Poudriere create a default ports tree for itself, using either `portsnap(8)` (if running FreeBSD 12.1 or 11.4) or Git (if running FreeBSD-CURRENT):
These commands create tank/poudriere/ports/default, mount it on /poudriere/ports/default, and populate it using Git, portsnap(8), or Subversion. Afterward it is included in the list of known ports trees:

```
# poudriere ports -c -m portsnap
or
# poudriere ports -c -m git+https -B main
```

Note that the "default" ports tree is special. Each of the build commands explained later will implicitly use this ports tree unless specifically specified otherwise. To use another tree, add `-p treename` to the commands.

While useful for regular bulk builds, having this default ports tree with the portsnap(8) method may not be the best way to deal with local modifications for a ports contributor. As with the creation of jails, it is possible to use a different method for creating the ports tree. To add an additional ports tree for testing local modifications and ports development, checking out the tree via Subversion (as described above) is preferable.

The http and https methods need devel/subversion built with the SERF option enabled. It is enabled by default.

The svn method allows extra qualifiers to tell Subversion exactly how to fetch data. This is explained in poudriere(8). For instance, `poudriere ports -c -m svn+ssh -p subversive` uses SSH for the checkout.

### 10.6.6. Using Manually Managed Ports Trees with Poudriere

Depending on the workflow, it can be extremely helpful to use ports trees which are maintained manually. For instance, if there is a local copy of the ports tree in /work/ports, point Poudriere to the location:

- For Poudriere older than version 3.1.20:

  ```
  # poudriere ports -c -F -f none -M /work/ports -p development
  ```

- For Poudriere version 3.1.20 and later:
This will be listed in the table of known trees:

<table>
<thead>
<tr>
<th>PORTSTREE</th>
<th>METHOD</th>
<th>TIMESTAMP</th>
<th>PATH</th>
</tr>
</thead>
<tbody>
<tr>
<td>development</td>
<td>null</td>
<td>2020-07-20 05:06:33</td>
<td>/work/ports</td>
</tr>
</tbody>
</table>

The dash or null in the METHOD column means that Poudriere will not update or change this ports tree, ever. It is completely up to the user to maintain this tree, including all local modifications that may be used for testing new ports and submitting patches.

10.6.7. Keeping Poudriere Ports Trees Updated

As straightforward as with jails described earlier:

```bash
# poudriere ports -u -p PORTSTREE
```

Will update the given PORTSTREE, one tree given by the output of `poudriere -l`, to the latest revision available on the official servers.

Ports trees without a method, see Using Manually Managed Ports Trees with Poudriere, cannot be updated like this. They must be updated manually by the porter.

10.6.8. Testing Ports

After jails and ports trees have been set up, the result of a contributor's modifications to the ports tree can be tested.

For example, local modifications to the www/firefox port located in /work/ports/www/firefox can be tested in the previously created 11.4-RELEASE jail:

```bash
# poudriere testport -j 114Ramd64 -p development -o www/firefox
```

This will build all dependencies of Firefox. If a dependency has been built previously and is still up-to-date, the pre-built package is installed. If a dependency has no up-to-date package, one will be built with default options in a jail. Then Firefox itself is built.

The complete build of every port is logged to /poudriere/data/logs/bulk/114Ri386-development/build-time/logs.

The directory name 114Ri386-development is derived from the arguments to -j and -p, respectively.
For convenience, a symbolic link /poudriere/data/logs/bulk/114Ri386-development/latest is also maintained. The link points to the latest **build-time** directory. Also in this directory is an index.html for observing the build process with a web browser.

By default, Poudriere cleans up the jails and leaves log files in the directories mentioned above. To ease investigation, jails can be kept running after the build by adding `-i` to `testport`:

```
# poudriere testport -j 114Ramd64 -p development -i -o www/firefox
```

After the build completes, and regardless of whether it was successful, a shell is provided within the jail. The shell is used to investigate further. Poudriere can be told to leave the jail running after the build finishes with `-I`. Poudriere will show the command to run when the jail is no longer needed. It is then possible to `jexec(8)` into it:

```
# poudriere testport -j 114Ramd64 -p development -I -o www/firefox
[...]
====>> Installing local Pkg repository to /usr/local/etc/pkg/repos
====>> Leaving jail 114Ramd64-development-n running, mounted at
/poudriere/data/.m/114Ramd64-development/ref for interactive run testing
====>> To enter jail: jexec 114Ramd64-development-n env -i TERM=$TERM /usr/bin/login
    -fp root
====>> To stop jail: poudriere jail -k -j 114Ramd64 -p development
# jexec 114Ramd64-development-n env -i TERM=$TERM /usr/bin/login -fp root
# [do some stuff in the jail]
# exit
# poudriere jail -k -j 114Ramd64 -p development
====>> Umounting file systems
```

An integral part of the FreeBSD ports build infrastructure is the ability to tweak ports to personal preferences with options. These can be tested with Poudriere as well. Adding the `-c`:

```
# poudriere testport -c -o www/firefox
```

Presents the port configuration dialog before the port is built. The ports given after `-o` in the format `category/portname` will use the specified options, all dependencies will use the default options. Testing dependent ports with non-default options can be accomplished using sets, see **Using Sets**.

When testing ports where pkg-plist is altered during build depending on the selected options, it is recommended to perform a test run with all options selected and one with all options deselected.

**10.6.9. Using Sets**

For all actions involving builds, a so-called set can be specified using `-z setname`. A set refers to a fully independent build. This allows, for instance, usage of `testport` with non-standard options for the dependent ports.
To use sets, Poudriere expects an existing directory structure similar to `PORT_DBDIR`, defaults to `/var/db/ports` in its configuration directory. This directory is then `nullfs(5)`-mounted into the jails where the ports and their dependencies are built. Usually a suitable starting point can be obtained by recursively copying the existing `PORT_DBDIR` to `/usr/local/etc/poudriere.d/jailname-portname-setname-options`. This is described in detail in `poudriere(8)`. For instance, testing `www/firefox` in a specific set named `devset`, add the `-z devset` parameter to the testport command:

```
# poudriere testport -j 114Ramd64 -p development -z devset -o www/firefox
```

This will look for the existence of these directories in this order:

- `/usr/local/etc/poudriere.d/114Ramd64-development-devset-options`
- `/usr/local/etc/poudriere.d/114Ramd64-devset-options`
- `/usr/local/etc/poudriere.d/114Ramd64-development-options`
- `/usr/local/etc/poudriere.d/devset-options`
- `/usr/local/etc/poudriere.d/development-options`
- `/usr/local/etc/poudriere.d/114Ramd64-options`
- `/usr/local/etc/poudriere.d/options`

From this list, Poudriere `nullfs(5)`-mounts the first existing directory tree into the `/var/db/ports` directory of the build jails. Hence, all custom options are used for all the ports during this run of `testport`.

After the directory structure for a set is provided, the options for a particular port can be altered. For example:

```
# poudriere options -c www/firefox -z devset
```

The configuration dialog for `www/firefox` is shown, and options can be edited. The selected options are saved to the `devset` set.

Poudriere is very flexible in the option configuration. They can be set for particular jails, ports trees, and for multiple ports by one command. Refer to `poudriere(8)` for details.

### 10.6.10. Providing a Custom make.conf File

Similar to using sets, Poudriere will also use a custom `make.conf` if it is provided. No special command line argument is necessary. Instead, Poudriere looks for existing files matching a name scheme derived from the command line. For instance:

```
# poudriere testport -j 114Ramd64 -p development -z devset -o www/firefox
```
causes Poudriere to check for the existence of these files in this order:

- /usr/local/etc/poudriere.d/make.conf
- /usr/local/etc/poudriere.d/devset-make.conf
- /usr/local/etc/poudriere.d/development-make.conf
- /usr/local/etc/poudriere.d/114Ramd64-make.conf
- /usr/local/etc/poudriere.d/114Ramd64-development-make.conf
- /usr/local/etc/poudriere.d/114Ramd64-devset-make.conf
- /usr/local/etc/poudriere.d/114Ramd64-development-devset-make.conf

Unlike with sets, all of the found files will be appended, *in that order*, into one make.conf inside the build jails. It is hence possible to have general make variables, intended to affect all builds in /usr/local/etc/poudriere.d/make.conf. Special variables, intended to affect only certain jails or sets can be set in specialised make.conf files, such as /usr/local/etc/poudriere.d/114Ramd64-development-devset-make.conf.

**Example 109. Using make.conf to Change Default Perl**

To build a set with a non default Perl version, for example, 5.20, using a set named `perl5-20`, create a `perl5-20-make.conf` with this line:

```plaintext
DEFAULT_VERSIONS+= perl=5.20
```

Note the use of `+=` so that if the variable is already set in the default make.conf its content will not be overwritten.

**10.6.11. Pruning no Longer Needed Distfiles**

Poudriere comes with a built-in mechanism to remove outdated distfiles that are no longer used by any port of a given tree. The command

```plaintext
# poudriere distclean -p portstree
```

will scan the distfiles folder, `DISTFILES_CACHE` in poudriere.conf, versus the ports tree given by the `-p portstree` argument and prompt for removal of those distfiles. To skip the prompt and remove all unused files unconditionally, the `-y` argument can be added:

```plaintext
# poudriere distclean -p portstree -y
```
Chapter 11. Upgrading a Port

When a port is not the most recent version available from the authors, update the local working copy of /usr/ports. The port might have already been updated to the new version.

When working with more than a few ports, it will probably be easier to use Git to keep the whole ports collection up-to-date, as described in the Handbook. This will have the added benefit of tracking all the port's dependencies.

The next step is to see if there is an update already pending. To do this, there are two options. There is a searchable interface to the FreeBSD Problem Report (PR) or bug database. Select Ports & Packages in the Product multiple select menu, and enter the name of the port in the Summary field.

However, sometimes people forget to put the name of the port into the Summary field in an unambiguous fashion. In that case, try searching in the Comment field in the Detailed Bug Information section, or try the FreeBSD Ports Monitoring System (also known as portsmon). This system attempts to classify port PRs by portname. To search for PRs about a particular port, use the Overview of One Port.

The FreeBSD Ports Monitoring System (portsmon) is currently not working due to latest Python updates.

If there is no pending PR, the next step is to send an email to the port's maintainer, as shown by make maintainer. That person may already be working on an upgrade, or have a reason to not upgrade the port right now (because of, for example, stability problems of the new version), and there is no need to duplicate their work. Note that unmaintained ports are listed with a maintainer of ports@FreeBSD.org, which is just the general ports mailing list, so sending mail there probably will not help in this case.

If the maintainer asks you to do the upgrade or there is no maintainer, then help out FreeBSD by preparing the update! Please do this by using the diff(1) command in the base system.

To create a suitable diff for a single patch, copy the file that needs patching to something.orig, save the changes to something and then create the patch:

```
% diff -u something.orig something > something.diff
```

Otherwise, either use the git diff method (Using Git to Make Patches) or copy the contents of the port to an entire different directory and use the result of the recursive diff(1) output of the new and old ports directories (for example, if the modified port directory is called superedit and the original is in our tree as superedit.bak, then save the result of diff -ruN superedit.bak superedit). Either unified or context diff is fine, but port committers generally prefer unified diffs. Note the use of the -N option—this is the accepted way to force diff to properly deal with the case of new files being added or old files being deleted. Before sending us the diff, please examine the output to make sure all the changes make sense. (In particular, make sure to first clean out the work directories with make clean).
If some files have been added, copied, moved, or removed, add this information to the problem report so that the committer picking up the patch will know what `git(1)` commands to run.

If the port is unmaintained, and you are actively using it, please consider volunteering to become its maintainer. FreeBSD has over 4000 ports without maintainers, and this is an area where more volunteers are always needed. (For a detailed description of the responsibilities of maintainers, refer to the section in the Developer's Handbook.)

To submit the diff, use the `bug submit form` (product Ports & Packages, component Individual Port(s)). Always include the category with the port name, followed by colon, and brief description of the issue. Examples: `category/portname: add FOO option; category/portname: Update to X.Y`. Please mention any added or deleted files in the message, as they have to be explicitly specified to `git(1)` when doing a commit. Do not compress or encode the diff.

Before submitting the bug, review the Writing the problem report section in the Problem Reports article. It contains far more information about how to write useful problem reports.

If the upgrade is motivated by security concerns or a serious fault in the currently committed port, please notify the Ports Management Team <portmgr@FreeBSD.org> to request immediate rebuilding and redistribution of the port's package. Unsuspecting users of `pkg` will otherwise continue to install the old version via `pkg install` for several weeks.

Please use `diff(1)` or `git diff` to create updates to existing ports. Other formats include the whole file and make it impossible to see just what has changed. When diffs are not included, the entire update might be ignored.

Now that all of that is done, read about how to keep up-to-date in Keeping Up.

## 11.1. Using Git to Make Patches

When possible, please submit a `git(1)` patch or diff. They are easier to handle than diffs between “new and old” directories. It is easier to see what has changed, and to update the diff if something was modified in the Ports Collection since the work on it began, or if the committer asks for something to be fixed. Also, a patch generated with `git-format-patch(1)` or `git-diff(1)` can be easily applied with `git-am(1)` or `git-apply(1)` and will save some time for the committer. Finally, the `git patch` generated by `git-format-patch(1)` includes your author information and commit messages. These will be recorded in the log of the repository and this is the recommended way to submit your changes.
% git clone https://git.FreeBSD.org/ports.git ~/my_wrkdir
% cd ~/my_wrkdir

① This can be anywhere, of course. Building ports is not limited to within /usr/ports/.
② git.FreeBSD.org is the FreeBSD public Git server. See FreeBSD Git Repository URL Table for more information.

While in the port directory, make any changes that are needed. If adding, moving, or removing a file, use git to track these changes:

% git add new_file
% git mv old_name new_name
% git rm deleted_file

Make sure to check the port using the checklist in Testing the Port and Checking the Port with portlint.

Before making the patch, fetch the latest repository and rebase the changes on top of it. Watch and follow the output carefully. If any of the files failed to rebase, it means that the upstream files changed while you were editing the same file, and the conflicts need to be resolved manually.

% git fetch origin main
% git rebase origin/main

Check the changes staged for the patch:

% git status
% git diff --staged

The last step is to make an unified diff or patch of the changes:

To generate an unified diff with git-diff(1):

% git diff --staged > ../`make -VPKGNAME`.diff

This will generate a diff named like foo-1.2.3.diff. Where foo is replaced with the first line of the commit message, i.e., the subject of the commit message.

To generate a patch with git-format-patch(1):

% git checkout -b my_branch
% git commit
% git format-patch main
This will generate a patch named like 0001-foo.patch.

After patch has been created, you can switch to the main branch for starting other developments.

% git checkout main

Once the patch is accepted and merged, you can delete the local development branch if you want:

% git branch -D my_branch

If files have been added, moved, or removed, include the `git(1) add, mv, and rm` commands that were used. `git mv` must be run before the patch can be applied. `git add` or `git rm` must be run after the patch is applied.

Send the patch following the problem report submission guidelines.

### 11.2. UPDATING and MOVED

#### 11.2.1. /usr/ports/UPDATING

If upgrading the port requires special steps like changing configuration files or running a specific program, it must be documented in this file. The format of an entry in this file is:

```
YYYYMMDD:
  AFFECTS: users of portcategory/portname
  AUTHOR: Your name <Your email address>

  Special instructions
```

When including exact portmaster, portupgrade, and/or pkg instructions, please make sure to get the shell escaping right. For example, do not use:

```
# pkg delete -g -f docbook-xml* docbook-sk* docbook[2345]?-* docbook-4*
```

As shown, the command will only work with bourne shells. Instead, use the form shown below, which will work with both bourne shell and c-shell:

```
# pkg delete -g -f docbook-xml\* docbook-sk\* docbook\[2345\\]??-\* docbook-4\\
```
It is recommended that the AFFECTS line contains a glob matching all the ports affected by the entry so that automated tools can parse it as easily as possible. If an update concerns all the existing BIND 9 versions the AFFECTS content must be users of dns/bind9*, it must not be users of BIND 9

11.2.2. /usr/ports/MOVED

This file is used to list moved or removed ports. Each line in the file is made up of the name of the port, where the port was moved, when, and why. If the port was removed, the section detailing where it was moved can be left blank. Each section must be separated by the | (pipe) character, like so:

| old name | new name (blank for deleted) | date of move | reason |

The date must be entered in the form YYYY-MM-DD. New entries are added to the end of the list to keep it in chronological order, with the oldest entry at the top of the list.

If a port was removed but has since been restored, delete the line in this file that states that it was removed.

If a port was renamed and then renamed back to its original name, add a new one with the intermediate name to the old name, and remove the old entry as to not create a loop.

Any changes must be validated with Tools/scripts/MOVEDlint.awk.

If using a ports directory other than /usr/ports, use:

% cd /home/user/ports
% env PORTSDIR=$PWD Tools/scripts/MOVEDlint.awk
Chapter 12. Security

12.1. Why Security is So Important

Bugs are occasionally introduced to the software. Arguably, the most dangerous of them are those opening security vulnerabilities. From the technical viewpoint, such vulnerabilities are to be closed by exterminating the bugs that caused them. However, the policies for handling mere bugs and security vulnerabilities are very different.

A typical small bug affects only those users who have enabled some combination of options triggering the bug. The developer will eventually release a patch followed by a new version of the software, free of the bug, but the majority of users will not take the trouble of upgrading immediately because the bug has never vexed them. A critical bug that may cause data loss represents a graver issue. Nevertheless, prudent users know that a lot of possible accidents, besides software bugs, are likely to lead to data loss, and so they make backups of important data; in addition, a critical bug will be discovered really soon.

A security vulnerability is all different. First, it may remain unnoticed for years because often it does not cause software malfunction. Second, a malicious party can use it to gain unauthorized access to a vulnerable system, to destroy or alter sensitive data; and in the worst case the user will not even notice the harm caused. Third, exposing a vulnerable system often assists attackers to break into other systems that could not be compromised otherwise. Therefore closing a vulnerability alone is not enough: notify the audience of it in the most clear and comprehensive manner, which will allow them to evaluate the danger and take appropriate action.

12.2. Fixing Security Vulnerabilities

While on the subject of ports and packages, a security vulnerability may initially appear in the original distribution or in the port files. In the former case, the original software developer is likely to release a patch or a new version instantly. Update the port promptly with respect to the author's fix. If the fix is delayed for some reason, either mark the port as FORBIDDEN or introduce a patch file to the port. In the case of a vulnerable port, just fix the port as soon as possible. In either case, follow the standard procedure for submitting changes unless having rights to commit it directly to the ports tree.

⚠ Being a ports committer is not enough to commit to an arbitrary port. Remember that ports usually have maintainers, must be respected.

Please make sure that the port's revision is bumped as soon as the vulnerability has been closed. That is how the users who upgrade installed packages on a regular basis will see they need to run an update. Besides, a new package will be built and distributed over FTP and WWW mirrors, replacing the vulnerable one. Bump PORTREVISION unless DISTVERSION has changed in the course of correcting the vulnerability. That is, bump PORTREVISION if adding a patch file to the port, but do not bump it if updating the port to the latest software version and thus already touched DISTVERSION. Please refer to the corresponding section for more information.
12.3. Keeping the Community Informed

12.3.1. The VuXML Database

A very important and urgent step to take as early after a security vulnerability is discovered as possible is to notify the community of port users about the jeopardy. Such notification serves two purposes. First, if the danger is really severe it will be wise to apply an instant workaround. For example, stop the affected network service or even deinstall the port completely until the vulnerability is closed. Second, a lot of users tend to upgrade installed packages only occasionally. They will know from the notification that they must update the package without delay as soon as a corrected version is available.

Given the huge number of ports in the tree, a security advisory cannot be issued on each incident without creating a flood and losing the attention of the audience when it comes to really serious matters. Therefore security vulnerabilities found in ports are recorded in the FreeBSD VuXML database. The Security Officer Team members also monitor it for issues requiring their intervention.

Committers can update the VuXML database themselves, assisting the Security Officer Team and delivering crucial information to the community more quickly. Those who are not committers or have discovered an exceptionally severe vulnerability should not hesitate to contact the Security Officer Team directly, as described on the FreeBSD Security Information page.

The VuXML database is an XML document. Its source file vuln.xml is kept right inside the port security/vuxml. Therefore the file's full pathname will be PORTSDIR/security/vuxml/vuln.xml. Each time a security vulnerability is discovered in a port, please add an entry for it to that file. Until familiar with VuXML, the best thing to do is to find an existing entry fitting the case at hand, then copy it and use it as a template.

12.3.2. A Short Introduction to VuXML

The full-blown XML format is complex, and far beyond the scope of this book. However, to gain basic insight on the structure of a VuXML entry only the notion of tags is needed. XML tag names are enclosed in angle brackets. Each opening <tag> must have a matching closing </tag>. Tags may be nested. If nesting, the inner tags must be closed before the outer ones. There is a hierarchy of tags, that is, more complex rules of nesting them. This is similar to HTML. The major difference is that XML is eXtensible, that is, based on defining custom tags. Due to its intrinsic structure XML puts otherwise amorphous data into shape. VuXML is particularly tailored to mark up descriptions of security vulnerabilities.

Now consider a realistic VuXML entry:
Several vulnerabilities found in Foo

Affects
- foo
- foo-devel
- ja-foo
  - ge 1.6
  - lt 1.9
- ge 2.0
- lt 2.4
- eq 3.0b1
- openfoo
  - lt 1.10
  - ge 1.2,1
  - lt 1.3,1

Description

J. Random Hacker reports:

Several issues in the Foo software may be exploited via carefully crafted QUUX requests. These requests will permit the injection of Bar code, mumble theft, and the readability of the Foo administrator account.

Dates
- Discovery 2010-05-25
- Entry 2010-07-13
- Modified 2010-09-17
The tag names are supposed to be self-explanatory so we shall take a closer look only at fields which needs to be filled in:

① This is the top-level tag of a VuXML entry. It has a mandatory attribute, vid, specifying a universally unique identifier (UUID) for this entry (in quotes). Generate a UUID for each new VuXML entry (and do not forget to substitute it for the template UUID unless writing the entry from scratch). Use uuidgen(1) to generate a VuXML UUID.

② This is a one-line description of the issue found.

③ The names of packages affected are listed there. Multiple names can be given since several packages may be based on a single master port or software product. This may include stable and development branches, localized versions, and slave ports featuring different choices of important build-time configuration options.

④ Affected versions of the package(s) are specified there as one or more ranges using a combination of <lt>, <le>, <eq>, <ge>, and <gt> elements. Check that the version ranges given do not overlap.
   In a range specification, * (asterisk) denotes the smallest version number. In particular, 2.* is less than 2.a. Therefore an asterisk may be used for a range to match all possible alpha, beta, and RC versions. For instance, <ge>2.</ge><lt>3.</lt> will selectively match every 2.x version while <ge>2.</ge><lt>3.</lt>/ will not since the latter misses 2.r3 and matches 3.b.
   The above example specifies that affected are versions 1.6 and up to but not including 1.9,
   versions 2.x before 2.4_1, and version 3.0b1.

⑤ Several related package groups (essentially, ports) can be listed in the <affected> section. This can be used if several software products (say FooBar, FreeBar and OpenBar) grow from the same code base and still share its bugs and vulnerabilities. Note the difference from listing multiple names within a single <package> section.

⑥ The version ranges have to allow for PORTEPOCH and PORTREVISION if applicable. Please remember that according to the collation rules, a version with a non-zero PORTEPOCH is greater than any version without PORTEPOCH, for example, 3.0,1 is greater than 3.1 or even than 8.9.

⑦ This is a summary of the issue. XHTML is used in this field. At least enclosing <p> and </p> has to appear. More complex mark-up may be used, but only for the sake of accuracy and clarity: No eye candy please.

⑧ This section contains references to relevant documents. As many references as apply are encouraged.

⑨ This is a FreeBSD security advisory.

⑩ This is a FreeBSD problem report.

⑪ This is a MITRE CVE identifier.

⑫ This is a SecurityFocus Bug ID.

⑬ This is a US-CERT security advisory.

⑭ This is a US-CERT vulnerability note.

⑮ This is a US-CERT Cyber Security Alert.

⑯ This is a US-CERT Technical Cyber Security Alert.

⑰ This is a URL to an archived posting in a mailing list. The attribute msgid is optional and may
specify the message ID of the posting.

① This is a generic URL. Only it if none of the other reference categories apply.

② This is the date when the issue was disclosed (YYYY-MM-DD).

③ This is the date when the entry was added (YYYY-MM-DD).

This is the date when any information in the entry was last modified (YYYY-MM-DD). New entries must not include this field. Add it when editing an existing entry.

### 12.3.3. Testing Changes to the VuXML Database

This example describes a new entry for a vulnerability in the package *dropbear* that has been fixed in version *dropbear-2013.59*.

As a prerequisite, install a fresh version of *security/vuxml* port.

First, check whether there already is an entry for this vulnerability. If there were such an entry, it would match the previous version of the package, *2013.58*:

```
% pkg audit dropbear-2013.58
```

If there is none found, add a new entry for this vulnerability.

```
% cd 
% make newentry
% make validate
```

Verify its syntax and formatting:

```
% make validate
```

The previous command generates the *vuln-flat.xml* file. It can also be generated with:

```
% make vuln-flat.xml
```

At least one of these packages needs to be installed: `textproc/libxml2`, `textproc/jade`.

Verify that the `<affected>` section of the entry will match the correct packages:

```
% pkg audit -f 
% dropbear-2013.58
```

Make sure that the entry produces no spurious matches in the output.

Now check whether the right package versions are matched by the entry:
% pkg audit -f `PORTSDIR`/security/vuxml/vuln-flat.xml dropbear-2013.58 dropbear-2013.59

dropbear-2012.58 is vulnerable:
dropbear -- exposure of sensitive information, DoS
CVE: CVE-2013-4434
CVE: CVE-2013-4421
WWW: http://portaudit.FreeBSD.org/8c9b48d1-3715-11e3-a624-00262d8b701d.html

1 problem(s) in the installed packages found.

The former version matches while the latter one does not.
Chapter 13. Dos and Don’ts

13.1. Introduction

Here is a list of common dos and don’ts that are encountered during the porting process. Check the port against this list, but also check ports in the PR database that others have submitted. Submit any comments on ports as described in Bug Reports and General Commentary. Checking ports in the PR database will both make it faster for us to commit them, and prove that you know what you are doing.

13.2. WRKDIR

Do not write anything to files outside WRKDIR. WRKDIR is the only place that is guaranteed to be writable during the port build (see installing ports from a CDROM for an example of building ports from a read-only tree). The pkg-* files can be modified by redefining a variable rather than overwriting the file.

13.3. WRKDIRPREFIX

Make sure the port honors WRKDIRPREFIX. Most ports do not have to worry about this. In particular, when referring to a WRKDIR of another port, note that the correct location is `${WRKDIRPREFIX}${PORTSDIR}/subdir/name/work` not `${PORTSDIR}/subdir/name/work` or `${.CURDIR}/../../subdir/name/work` or some such.

13.4. Differentiating Operating Systems and OS Versions

Some code needs modifications or conditional compilation based upon what version of FreeBSD Unix it is running under. The preferred way to tell FreeBSD versions apart are the __FreeBSD_version and __FreeBSD__ macros defined in sys/param.h. If this file is not included add the code,

```c
#include <sys/param.h>
```

to the proper place in the .c file.

__FreeBSD__ is defined in all versions of FreeBSD as their major version number. For example, in FreeBSD 9.x, __FreeBSD__ is defined to be 9.

```c
#if __FreeBSD__ >= 9
    # if __FreeBSD_version >= 901000
        /* 9.1+ release specific code here */
    # endif
#endif
```
A complete list of `__FreeBSD_version` values is available in `__FreeBSD_version Values`.

### 13.5. Writing Something After bsd.port.mk

Do not write anything after the `.include <bsd.port.mk>` line. It usually can be avoided by including bsd.port.pre.mk somewhere in the middle of the Makefile and bsd.port.post.mk at the end.

![Warning]
Include either the bsd.port.pre.mk/bsd.port.post.mk pair or bsd.port.mk only; do not mix these two usages.

bsd.port.pre.mk only defines a few variables, which can be used in tests in the Makefile, bsd.port.post.mk defines the rest.

Here are some important variables defined in bsd.port.pre.mk (this is not the complete list, please read bsd.port.mk for the complete list).

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCH</td>
<td>The architecture as returned by <code>uname -m</code> (for example, <code>i386</code>)</td>
</tr>
<tr>
<td>OPSYS</td>
<td>The operating system type, as returned by <code>uname -s</code> (for example, FreeBSD)</td>
</tr>
<tr>
<td>OSREL</td>
<td>The release version of the operating system (for example, 2.1.5 or 2.2.7)</td>
</tr>
<tr>
<td>OSVERSION</td>
<td>The numeric version of the operating system; the same as <code>__FreeBSD_version</code></td>
</tr>
<tr>
<td>LOCALBASE</td>
<td>The base of the &quot;local&quot; tree (for example, <code>/usr/local</code>)</td>
</tr>
<tr>
<td>PREFIX</td>
<td>Where the port installs itself (see more on <code>PREFIX</code>).</td>
</tr>
</tbody>
</table>

When `MASTERDIR` is needed, always define it before including bsd.port.pre.mk.

Here are some examples of things that can be added after bsd.port.pre.mk:

```
# no need to compile lang/perl5 if perl5 is already in system
.if ${OSVERSION} > 300003
  BROKEN= perl is in system
.endif
```

Always use tab instead of spaces after `BROKEN=`.
13.6. Use the `exec` Statement in Wrapper Scripts

If the port installs a shell script whose purpose is to launch another program, and if launching that program is the last action performed by the script, make sure to launch the program using the `exec` statement, for instance:

```bash
#!/bin/sh
exec %LOCALBASE%/bin/java -jar %DATADIR%/foo.jar "$@
```

The `exec` statement replaces the shell process with the specified program. If `exec` is omitted, the shell process remains in memory while the program is executing, and needlessly consumes system resources.

13.7. Do Things Rationally

The `Makefile` should do things in a simple and reasonable manner. Making it a couple of lines shorter or more readable is always better. Examples include using a `make .if` construct instead of a shell `if` construct, not redefining `do-extract` if redefining `EXTRACT*` is enough, and using `GNU_CONFIGURE` instead of `CONFIGURE_ARGS += --prefix=${PREFIX}`.

If a lot of new code is needed to do something, there may already be an implementation of it in `bsd.port.mk`. While hard to read, there are a great many seemingly-hard problems for which `bsd.port.mk` already provides a shorthand solution.

13.8. Respect Both `CC` and `CXX`

The port must respect both `CC` and `CXX`. What we mean by this is that the port must not set the values of these variables absolutely, overriding existing values; instead, it may append whatever values it needs to the existing values. This is so that build options that affect all ports can be set globally.

If the port does not respect these variables, please add `NO_PACKAGE=ignores either cc or cxx` to the `Makefile`.

Here is an example of a `Makefile` respecting both `CC` and `CXX`. Note the `?=`:

```bash
CC?= gcc
CXX?= g++
```

Here is an example which respects neither `CC` nor `CXX`:

```bash
CC= gcc
```
Both `CC` and `CXX` can be defined on FreeBSD systems in `/etc/make.conf`. The first example defines a value if it was not previously set in `/etc/make.conf`, preserving any system-wide definitions. The second example clobbers anything previously defined.

### 13.9. Respect `CFLAGS`

The port must respect `CFLAGS`. What we mean by this is that the port must not set the value of this variable absolutely, overriding the existing value. Instead, it may append whatever values it needs to the existing value. This is so that build options that affect all ports can be set globally.

If it does not, please add `NO_PACKAGE=ignores cflags` to the `Makefile`.

Here is an example of a `Makefile` respecting `CFLAGS`. Note the `+=`:

```bash
CFLAGS+= -Wall -Werror
```

Here is an example which does not respect `CFLAGS`:

```bash
CFLAGS= -Wall -Werror
```

`CFLAGS` is defined on FreeBSD systems in `/etc/make.conf`. The first example appends additional flags to `CFLAGS`, preserving any system-wide definitions. The second example clobbers anything previously defined.

Remove optimization flags from the third party `Makefile`s. The system `CFLAGS` contains system-wide optimization flags. An example from an unmodified `Makefile`:

```bash
CFLAGS= -O3 -funroll-loops -DHAVE_SOUND
```

Using system optimization flags, the `Makefile` would look similar to this example:

```bash
CFLAGS+= -DHAVE_SOUND
```

### 13.10. Verbose Build Logs

Make the port build system display all commands executed during the build stage. Complete build logs are crucial to debugging port problems.

Non-informative build log example (bad):
### 13.11. Feedback

Do send applicable changes and patches to the upstream maintainer for inclusion in the next release of the code. This makes updating to the next release that much easier.

### 13.12. README.html

README.html is not part of the port, but generated by `make readme`. Do not include this file in patches or commits.

> If `make readme` fails, make sure that the default value of `ECHO_MSG` has not been modified by the port.

### 13.13. Marking a Port Not Installable with **BROKEN**, **FORBIDDEN**, or **IGNORE**

In certain cases, users must be prevented from installing a port. There are several variables that can be used in a port's `Makefile` to tell the user that the port cannot be installed. The value of these make variables will be the reason that is shown to users for why the port refuses to install itself. Please use the correct make variable. Each variable conveys radically different meanings, both to users and to automated systems that depend on `Makefile`s, such as the ports build cluster, FreshPorts, and portsmon.

#### 13.13.1. Variables

- **BROKEN** is reserved for ports that currently do not compile, install, deinstall, or run correctly. Use it for ports where the problem is believed to be temporary.

  If instructed, the build cluster will still attempt to try to build them to see if the underlying problem has been resolved. (However, in general, the cluster is run without this.)

  For instance, use **BROKEN** when a port:
• does not compile
• fails its configuration or installation process
• installs files outside of `${PREFIX}`
• does not remove all its files cleanly upon deinstall (however, it may be acceptable, and desirable, for the port to leave user-modified files behind)
• has runtime issues on systems where it is supposed to run fine.

• **FORBIDDEN** is used for ports that contain a security vulnerability or induce grave concern regarding the security of a FreeBSD system with a given port installed (for example, a reputedly insecure program or a program that provides easily exploitable services). Mark ports as **FORBIDDEN** as soon as a particular piece of software has a vulnerability and there is no released upgrade. Ideally upgrade ports as soon as possible when a security vulnerability is discovered so as to reduce the number of vulnerable FreeBSD hosts (we like being known for being secure), however sometimes there is a noticeable time gap between disclosure of a vulnerability and an updated release of the vulnerable software. Do not mark a port **FORBIDDEN** for any reason other than security.

• **IGNORE** is reserved for ports that must not be built for some other reason. Use it for ports where the problem is believed to be structural. The build cluster will not, under any circumstances, build ports marked as **IGNORE**. For instance, use **IGNORE** when a port:
  • does not work on the installed version of FreeBSD
  • has a distfile which may not be automatically fetched due to licensing restrictions
  • does not work with some other currently installed port (for instance, the port depends on `www/apache20` but `www/apache22` is installed)

  If a port would conflict with a currently installed port (for example, if they install a file in the same place that performs a different function), use **CONFLICTS** instead. **CONFLICTS** will set **IGNORE** by itself.

### 13.13.2. Implementation Notes

Do not quote the values of **BROKEN**, **IGNORE**, and related variables. Due to the way the information is shown to the user, the wording of messages for each variable differ:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BROKEN</strong></td>
<td>fails to link with base -lcrypto</td>
</tr>
<tr>
<td><strong>IGNORE</strong></td>
<td>unsupported on recent versions</td>
</tr>
</tbody>
</table>

resulting in this output from `make describe`:

```bash
==> foobar-0.1 is marked as broken: fails to link with base -lcrypto.
```

FreeBSD runs on many more processor architectures than just the well-known x86-based ones. Some ports have constraints which are particular to one or more of these architectures.

For the list of supported architectures, run:

```bash
cd ${SRCDIR}; make targets
```

The values are shown in the form `TARGET/TARGET_ARCH`. The ports read-only makevar `ARCH` is set based on the value of `TARGET_ARCH`. Port Makefiles should test the value of this Makevar.

13.14.2. Marking a Port as Architecture Neutral

Ports that do not have any architecture-dependent files or requirements are identified by setting `NO_ARCH=yes`.

`NO_ARCH` is meant to indicate that there is no need to build a package for each of the supported architectures. The goal is to reduce the amount of resources spent on building and distributing the packages such as network bandwidth and disk space on mirrors and on distribution media. Currently, however, our package infrastructure (e.g., package managers, mirrors, and package builders) is not set up to fully benefit from `NO_ARCH`.

13.14.3. Marking a Port as Ignored Only On Certain Architectures

- To mark a port as `IGNORE`d only on certain architectures, there are two other convenience variables that will automatically set `IGNORE: ONLY_FOR_ARCHS` and `NOT_FOR_ARCHS`. Examples:

  ```
  ONLY_FOR_ARCHS= i386 amd64
  NOT_FOR_ARCHS= ia64 sparc64
  ```

  A custom `IGNORE` message can be set using `ONLY_FOR_ARCHS_REASON` and `NOT_FOR_ARCHS_REASON`. Per architecture entries are possible with `ONLY_FOR_ARCHS_REASON_ARCH` and `NOT_FOR_ARCHS_REASON_ARCH`.

  - If a port fetches i386 binaries and installs them, set `IA32_BINARY_PORT`. If this variable is set, `/usr/lib32` must be present for IA32 versions of libraries and the kernel must support IA32
compatibility. If one of these two dependencies is not satisfied, **IGNORE** will be set automatically.

### 13.14.4. Cluster-Specific Considerations

- Some ports attempt to tune themselves to the exact machine they are being built on by specifying `-march=native` to the compiler. This should be avoided: either list it under an off-by-default option, or delete it entirely.

  Otherwise, the default package produced by the build cluster might not run on every single machine of that `ARCH`.

### 13.15. Marking a Port for Removal with **DEPRECATED** or **EXPIRATION_DATE**

Do remember that **BROKEN** and **FORBIDDEN** are to be used as a temporary resort if a port is not working. Permanently broken ports will be removed from the tree entirely.

When it makes sense to do so, users can be warned about a pending port removal with **DEPRECATED** and **EXPIRATION_DATE**. The former is a string stating why the port is scheduled for removal; the latter is a string in ISO 8601 format (YYYY-MM-DD). Both will be shown to the user.

It is possible to set **DEPRECATED** without an **EXPIRATION_DATE** (for instance, recommending a newer version of the port), but the converse does not make any sense.

There is no set policy on how much notice to give. Current practice seems to be one month for security-related issues and two months for build issues. This also gives any interested committers a little time to fix the problems.

### 13.16. Avoid Use of the `.error` Construct

The correct way for a Makefile to signal that the port cannot be installed due to some external factor (for instance, the user has specified an illegal combination of build options) is to set a non-blank value to **IGNORE**. This value will be formatted and shown to the user by `make install`.

It is a common mistake to use `.error` for this purpose. The problem with this is that many automated tools that work with the ports tree will fail in this situation. The most common occurrence of this is seen when trying to build `/usr/ports/INDEX` (see Running `make describe`). However, even more trivial commands such as `make maintainer` also fail in this scenario. This is not acceptable.
1. How to Avoid Using `.error`

The first of the next two Makefile snippets will cause `make index` to fail, while the second one will not:

```
.error "option is not supported"
```

```
IGNORE=option is not supported
```

---

13.17. Usage of `sysctl`

The usage of `sysctl` is discouraged except in targets. This is because the evaluation of any `makevars`, such as used during `make index`, then has to run the command, further slowing down that process.

Only use `sysctl(8)` through `SYSCTL`, as it contains the fully qualified path and can be overridden, if one has such a special need.

---

13.18. Rerolling Distfiles

Sometimes the authors of software change the content of released distfiles without changing the file's name. Verify that the changes are official and have been performed by the author. It has happened in the past that the distfile was silently altered on the download servers with the intent to cause harm or compromise end user security.

Put the old distfile aside, download the new one, unpack them and compare the content with `diff(1)`. If there is nothing suspicious, update `distinfo`.

Be sure to summarize the differences in the PR and commit log, so that other people know that nothing bad has happened.

Contact the authors of the software and confirm the changes with them.

---

13.19. Use POSIX Standards

FreeBSD ports generally expect POSIX compliance. Some software and build systems make assumptions based on a particular operating system or environment that can cause problems when used in a port.

Do not use `/proc` if there are any other ways of getting the information. For example, `setprogtname(argv[0])` in `main()` and then `getprogtname(3)` to know the executable name.

Do not rely on behavior that is undocumented by POSIX.

Do not record timestamps in the critical path of the application if it also works without. Getting timestamps may be slow, depending on the accuracy of timestamps in the OS. If timestamps are
really needed, determine how precise they have to be and use an API which is documented to just deliver the needed precision.

A number of simple syscalls (for example `gettimeofday(2)`, `getpid(2)`) are much faster on Linux® than on any other operating system due to caching and the vsyscall performance optimizations. Do not rely on them being cheap in performance-critical applications. In general, try hard to avoid syscalls if possible.

Do not rely on Linux®-specific socket behavior. In particular, default socket buffer sizes are different (call `setsockopt(2)` with `SO_SNDBUF` and `SO_RCVBUF`, and while Linux®’s `send(2)` blocks when the socket buffer is full, FreeBSD’s will fail and set `ENOBUS` in errno.

If relying on non-standard behavior is required, encapsulate it properly into a generic API, do a check for the behavior in the configure stage, and stop if it is missing.

Check the man pages to see if the function used is a POSIX interface (in the "STANDARDS" section of the man page).

Do not assume that `/bin/sh` is bash. Ensure that a command line passed to `system(3)` will work with a POSIX compliant shell.

A list of common bashisms is available here.

Check that headers are included in the POSIX or man page recommended way. For example, `sys/types.h` is often forgotten, which is not as much of a problem for Linux® as it is for FreeBSD.

### 13.20. Miscellanea

Always double-check `pkg-descr` and `pkg-plist`. If reviewing a port and a better wording can be achieved, do so.

Do not copy more copies of the GNU General Public License into our system, please.

Please be careful to note any legal issues! Do not let us illegally distribute software!
Chapter 14. A Sample Makefile

Here is a sample Makefile that can be used to create a new port. Make sure to remove all the extra comments (ones between brackets).

The format shown is the recommended one for ordering variables, empty lines between sections, and so on. This format is designed so that the most important information is easy to locate. We recommend using `portlint` to check the Makefile.

```makefile
PORTNAME=  xdvi
DISTVERSION=  18.2
CATEGORIES=  print

MASTER_SITES=   ${MASTER_SITE_XCONTRIB}
MASTER_SITE_SUBDIR=  applications
PKGNAMEPREFIX=  ja-
DISTNAME= xdvi-pl18

PATCHFILES=  xdvi-18.patch1.gz xdvi-18.patch2.gz

MAINTAINER=  asami@FreeBSD.org
COMMENT=    DVI Previewer for the X Window System

LICENSE=    BSD2CLAUSE
LICENSE_FILE=   ${WRKSRC}/LICENSE

RUN_DEPENDS=    gs:print/ghostscript
```

[If it requires GNU make, not /usr/bin/make, to build...]

USES = gmake
[If it is an X application and requires "xmkmf -a" to be run...]
USES = imake

[this section is for other standard bsd.port.mk variables that do not]

[If it asks questions during configure, build, install...]
IS_INTERACTIVE = yes
[If it extracts to a directory other than ${DISTNAME}...]
WRKSRCT = ${WRKDIR}/xdvi-new
[If it requires a "configure" script generated by GNU autoconf to be run]
GNU_CONFIGURE = yes
[et cetera.]

[If it requires options, this section is for options]
OPTIONS_DEFINE = DOCS EXAMPLES FOO
OPTIONS_DEFAULT = FOO
[If options will change the files in plist]
OPTIONS_SUB = yes

FOO_DESC = Enable foo support

FOO_CONFIGURE_ENABLE = foo

[non-standard variables to be used in the rules below]
MY_FAVORITE_RESPONSE = "yeah, right"

[then the special rules, in the order they are called]
pre-fetch:
    i go fetch something, yeah

post-patch:
    i need to do something after patch, great

pre-install:
    and then some more stuff before installing, wow

[and then the epilogue]
.include <bsd.port.mk>
Chapter 15. Order of Variables in Port Makefiles

The first sections of the Makefile must always come in the same order. This standard makes it so everyone can easily read any port without having to search for variables in a random order.

The sections and variables described here are mandatory in a ordinary port. In a slave port, many sections and variables can be skipped.

Each following block must be separated from the previous block by a single blank line.

In the following blocks, only set the variables that are required by the port. Define these variables in the order they are shown here.

15.1. PORTNAME Block

This block is the most important. It defines the port name, version, distribution file location, and category. The variables must be in this order:

- PORTNAME
- PORTVERSION[1]
- DISTVERSIONPREFIX
- DISTVERSION[1]
- DISTVERSIONSUFFIX
- PORTREVISION
- PORTEPOCH
- CATEGORIES
- MASTER_SITES
- MASTER_SITE_SUBDIR (deprecated)
- PKGNAMEPREFIX
- PKGNAMESUFFIX
- DISTNAME
- EXTRACT_SUFX
- DISTFILES
- DIST_SUBDIR
- EXTRACT_ONLY

Only one of PORTVERSION and DISTVERSION can be used.
15.2. **PATCHFILES Block**

This block is optional. The variables are:

- PATCH_SITES
- PATCHFILES
- PATCH_DIST_STRIP

15.3. **MAINTAINER Block**

This block is mandatory. The variables are:

- MAINTAINER
- COMMENT

15.4. **LICENSE Block**

This block is optional, although it is highly recommended. The variables are:

- LICENSE
- LICENSE_COMB
- LICENSE_GROUPS or LICENSE_GROUPS_NAME
- LICENSE_NAME or LICENSE_NAME_NAME
- LICENSE_TEXT or LICENSE_TEXT_NAME
- LICENSE_FILE or LICENSE_FILE_NAME
- LICENSE_PERMS or LICENSE_PERMS_NAME
- LICENSE_DISTFILES or LICENSE_DISTFILES_NAME

If there are multiple licenses, sort the different LICENSE_VAR_NAME variables by license name.

15.5. **Generic BROKEN/IGNORE/DEPRECATED Messages**

This block is optional. The variables are:

- DEPRECATED
- EXPIRATION_DATE
- FORBIDDEN
- BROKEN
- BROKEN_*
- IGNORE
- IGNORE_*
BROKEN_* and IGNORE_* can be any generic variables, for example, IGNORE_amd64, BROKEN_FreeBSD_10, etc. With the exception of variables that depend on a USES, place those in USES and USE_x. For instance, IGNORE_WITH_PHP only works if php is set, and BROKEN_SSL only if ssl is set.

If the port is marked BROKEN when some conditions are met, and such conditions can only be tested after including bsd.port.options.mk or bsd.port.pre.mk, then those variables should be set later, in The Rest of the Variables.

15.6. The Dependencies Block

This block is optional. The variables are:

- FETCH_DEPENDS
- EXTRACT_DEPENDS
- PATCH_DEPENDS
- BUILD_DEPENDS
- LIB_DEPENDS
- RUN_DEPENDS
- TEST_DEPENDS

15.7. Flavors

This block is optional.

Start this section with defining FLAVORS. Continue with the possible Flavors helpers. See Using FLAVORS for more Information.

Constructs setting variables not available as helpers using .if ${FLAVOR:U} == foo should go in their respective sections below.

15.8. USES and USE_x

Start this section with defining USES, and then possible USE_x.

Keep related variables close together. For example, if using USE_GITHUB, always put the GH_* variables right after it.
15.9. Standard bsd.port.mk Variables

This section block is for variables that can be defined in bsd.port.mk that do not belong in any of the previous section blocks.

Order is not important, however try to keep similar variables together. For example uid and gid variables USR and GROUP. Configuration variables CONFIGURE_* and *_CONFIGURE. List of files, and directories PORTDOCS and PORTEXAMPLES.

15.10. Options and Helpers

If the port uses the options framework, define OPTIONS_DEFINE and OPTIONS_DEFAULT first, then the other OPTIONS_* variables first, then the _DESC descriptions, then the options helpers. Try and sort all of those alphabetically.

例 111. Options Variables Order Example

The FOO and BAR options do not have a standard description, so one need to be written. The other options already have one in Mk/bsd.options.desc.mk so writing one is not needed. The DOCS and EXAMPLES use target helpers to install their files, they are shown here for completeness, though they belong in The Targets, so other variables and targets could be inserted before them.

```
OPTIONS_DEFINE= DOCS EXAMPLES FOO BAR
OPTIONS_DEFAULT=    FOO
OPTIONS_RADIO=  SSL
OPTIONS_RADIO_SSL= OPENSSL GNUTLS
OPTIONS_SUB=    yes

BAR_DESC=       Enable bar support
FOO_DESC=       Enable foo support

BAR_CONFIGURE_WITH= bar=${LOCALBASE}
FOO_CONFIGURE_ENABLE=   foo
GNUTLS_CONFIGURE_ON=    --with-ssl=gnutls
OPENSSL_CONFIGURE_ON=   --with-ssl=openssl

post-install-DOCS-on:
    ${MKDIR} ${STAGEDIR}${DOCSDIR}
    cd ${WRKSRC}/doc && ${COPYTREE_SHARE} . ${STAGEDIR}${DOCSDIR}

post-install-EXAMPLES-on:
    ${MKDIR} ${STAGEDIR}${EXAMPLESDIR}
    cd ${WRKSRC}/ex && ${COPYTREE_SHARE} . ${STAGEDIR}${EXAMPLESDIR}
```
15.11. The Rest of the Variables

And then, the rest of the variables that are not mentioned in the previous blocks.

15.12. The Targets

After all the variables are defined, the optional `make(1)` targets can be defined. Keep `pre-` before `post-` and in the same order as the different stages run:

- fetch
- extract
- patch
- configure
- build
- install
- test

When using options helpers target keep them alphabetically sorted, but keep the `on` before the `off`. When also using the main target, keep the main target before the optional ones:

```
post-install:
    # install generic bits

post-install-DOCS-on:
    # Install documentation

post-install-X11-on:
    # Install X11 related bits

post-install-X11-off:
    # Install bits that should be there if X11 is disabled
```
Chapter 16. Keeping Up

The FreeBSD Ports Collection is constantly changing. Here is some information on how to keep up.

16.1. FreshPorts

One of the easiest ways to learn about updates that have already been committed is by subscribing to FreshPorts. Multiple ports can be monitored. Maintainers are strongly encouraged to subscribe, because they will receive notification of not only their own changes, but also any changes that any other FreeBSD committer has made. (These are often necessary to keep up with changes in the underlying ports framework—although it would be most polite to receive an advance heads-up from those committing such changes, sometimes this is overlooked or impractical. Also, in some cases, the changes are very minor in nature. We expect everyone to use their best judgement in these cases.)

To use FreshPorts, an account is required. Those with registered email addresses at @FreeBSD.org will see the opt-in link on the right-hand side of the web pages. Those who already have a FreshPorts account but are not using a @FreeBSD.org email address can change the email to @FreeBSD.org, subscribe, then change it back again.

FreshPorts also has a sanity test feature which automatically tests each commit to the FreeBSD ports tree. If subscribed to this service, a committer will receive notifications of any errors which FreshPorts detects during sanity testing of their commits.

16.2. The Web Interface to the Source Repository

It is possible to browse the files in the source repository by using a web interface. Changes that affect the entire port system are now documented in the CHANGES file. Changes that affect individual ports are now documented in the UPDATING file. However, the definitive answer to any question is undoubtedly to read the source code of bsd.port.mk, and associated files.

16.3. The FreeBSD Ports Mailing List

As a ports maintainer, consider subscribing to FreeBSD ports 郵件論壇. Important changes to the way ports work will be announced there, and then committed to CHANGES.

If the volume of messages on this mailing list is too high, consider following FreeBSD ports announce mailing list which contains only announcements.

16.4. The FreeBSD Port Building Cluster

One of the least-publicized strengths of FreeBSD is that an entire cluster of machines is dedicated to continually building the Ports Collection, for each of the major OS releases and for each Tier-1 architecture.

Individual ports are built unless they are specifically marked with IGNORE. Ports that are marked with BROKEN will still be attempted, to see if the underlying problem has been resolved. (This is done
by passing `TRYBROKEN` to the port's Makefile.)

## 16.5. Portscout: the FreeBSD Ports Distfile Scanner

The build cluster is dedicated to building the latest release of each port with distfiles that have already been fetched. However, as the Internet continually changes, distfiles can quickly go missing. Portscout, the FreeBSD Ports distfile scanner, attempts to query every download site for every port to find out if each distfile is still available. Portscout can generate HTML reports and send emails about newly available ports to those who request them. Unless not otherwise subscribed, maintainers are asked to check periodically for changes, either by hand or using the RSS feed.

Portscout's first page gives the email address of the port maintainer, the number of ports the maintainer is responsible for, the number of those ports with new distfiles, and the percentage of those ports that are out-of-date. The search function allows for searching by email address for a specific maintainer, and for selecting whether only out-of-date ports are shown.

Upon clicking on a maintainer's email address, a list of all of their ports is displayed, along with port category, current version number, whether or not there is a new version, when the port was last updated, and finally when it was last checked. A search function on this page allows the user to search for a specific port.

Clicking on a port name in the list displays the FreshPorts port information.

Additional documentation is available in the Portscout repository.

## 16.6. The FreeBSD Ports Monitoring System

Another handy resource is the FreeBSD Ports Monitoring System (also known as `portsmon`). This system comprises a database that processes information from several sources and allows it to be browsed via a web interface. Currently, the ports Problem Reports (PRs), the error logs from the build cluster, and individual files from the ports collection are used. In the future, this will be expanded to include the distfile survey, as well as other sources.

To get started, use the Overview of One Port search page to find all the information about a port.

This is the only resource available that maps PR entries to portnames. PR submitters do not always include the portname in their Synopsis, although we would prefer that they did. So, `portsmon` is a good place to find out whether an existing port has any PRs filed against it, any build errors, or if a new port the porter is considering creating has already been submitted.

The FreeBSD Ports Monitoring System (portsmon) is currently not working due to latest Python updates.
Chapter 17. Using USES Macros

17.1. An Introduction to USES

USES macros make it easy to declare requirements and settings for a port. They can add dependencies, change building behavior, add metadata to packages, and so on, all by selecting simple, preset values.

Each section in this chapter describes a possible value for USES, along with its possible arguments. Arguments are appended to the value after a colon (:``). Multiple arguments are separated by commas (`,`).

Example 112. Using Multiple Values

```
USES=   bison perl
```

Example 113. Adding an Argument

```
USES=   tar:xz
```

Example 114. Adding Multiple Arguments

```
USES=   drupal:7,theme
```

Example 115. Mixing it All Together

```
USES=   pgsql:9.3+ cpe python:2.7,build
```

17.2. 7z

Possible arguments: (none), p7zip, partial

Extract using 7z(1) instead of bsdtar(1) and sets EXTRACT_SUFX=.7z. The p7zip option forces a dependency on the 7z from archivers/p7zip if the one from the base system is not able to extract the files. EXTRACT_SUFX is not changed if the partial option is used, this can be used if the main distribution file does not have a .7z extension.
17.3. **ada**

Possible arguments: (none), 5, 6

Depends on an Ada-capable compiler, and sets `CC` accordingly. Defaults to use gcc 5 from ports. Use the `:_X_` version option to force building with a different version.

17.4. **autoreconf**

Possible arguments: (none), `build`

Runs `autoreconf`. It encapsulates the `aclocal`, `autoconf`, `autoheader`, `automake`, `autopoint`, and `libtoolize` commands. Each command applies to `{AUTORECONF_WRKSRC}/configure.ac or its old name, `{AUTORECONF_WRKSRC}/configure.in. If configure.ac defines subdirectories with their own configure.ac using `AC_CONFIG_SUBDIRS`, `autoreconf` will recursively update those as well. The `:build` argument only adds build time dependencies on those tools but does not run `autoreconf`. A port can set `AUTORECONF_WRKSRC` if `WRKSRC` does not contain the path to configure.ac.

17.5. **blaslapack**

Possible arguments: (none), `atlas`, `netlib` (default), `gotoblas`, `openblas`

Adds dependencies on Blas / Lapack libraries.

17.6. **bdb**

Possible arguments: (none), 48, 5 (default), 6

Add dependency on the Berkeley DB library. Default to `databases/db5`. It can also depend on `databases/db48` when using the `:48` argument or `databases/db6` with `:6`. It is possible to declare a range of acceptable values, `:48+` finds the highest installed version, and falls back to 4.8 if nothing else is installed. `INVALID_BDB_VER` can be used to specify versions which do not work with this port. The framework exposes the following variables to the port:

**BDB_LIB_NAME**

The name of the Berkeley DB library. For example, when using `databases/db5`, it contains `db-5.3`.

**BDB_LIB_CXX_NAME**

The name of the Berkeley DBC++ library. For example, when using `databases/db5`, it contains `db_cxx-5.3`.

**BDB_INCLUDE_DIR**

The location of the Berkeley DB include directory. For example, when using `databases/db5`, it will contain `{LOCALBASE}/include/db5`.

**BDB_LIB_DIR**

The location of the Berkeley DB library directory. For example, when using `databases/db5`, it contains `{LOCALBASE}/lib`.
The detected Berkeley DB version. For example, if using `USES=bdb:48+` and Berkeley DB 5 is installed, it contains 5.

⚠️ `databases/db48` is deprecated and unsupported. It must not be used by any port.

### 17.7. bison

Possible arguments: (none), build, run, both

Uses `devel/bison`. By default, with no arguments or with the build argument, it implies `bison` is a build-time dependency, run implies a run-time dependency, and both implies both run-time and build-time dependencies.

### 17.8. cabal

⚠️ Ports should not be created for Haskell libraries, see Haskell Libraries for more information.

Possible arguments: (none), hpack

Sets default values and targets used to build Haskell software using Cabal. A build dependency on the Haskell compiler port (GHC) is added. If the hpack argument is given, a build dependency on `devel/hs-hpack` is added and hpack is invoked at configuration step to generate the cabal file.

The framework provides the following variables:

**USE_CABAL**

If the software uses Haskell dependencies, list them in this variable. Each item should be present on Hackage and be listed in form `packagename-0.1.2`. Dependencies can have revisions, which are specified after the `_` symbol. Automatic generation of dependency list is supported, see Building Haskell Applications with cabal.

**CABAL_FLAGS**

List of flags to be passed to `cabal-install` during the configuring and building stage. The flags are passed verbatim.

**EXECUTABLES**

List of executable files installed by the port. Default value: `${PORTNAME}`. Items from this list are automatically added to pkg-plist.

**SKIP_CABAL_PLIST**

If defined, do not add items from `${EXECUTABLES}` to pkg-plist.

**opt_USE_CABAL**

Adds items to `${USE_CABAL}` depending on opt option.
**opt_EXECUTABLES**

Adds items to `$(EXECUTABLES)` depending on `opt` option.

**opt_CABAL_FLAGS**

If `opt` is enabled, append the value to `$(CABAL_FLAGS)`. Otherwise, append `-value` to disable the flag.

**FOO_DATADIR_VARS**

For an executable named `FOO` list Haskell packages, whose data files should be accessible by the executable.

### 17.9. cargo

Possible arguments: (none)

Uses Cargo for configuring, building, and testing. It can be used to port Rust applications that use the Cargo build system. For more information see [Building Rust Applications with cargo](#).

### 17.10. charsetfix

Possible arguments: (none)

Prevents the port from installing charset.alias. This must be installed only by `converters/libiconv`. `CHARSETFIX_MAKEFILEIN` can be set to a path relative to `WRKSRC` if charset.alias is not installed by `${WRKSRC}/Makefile.in`.

### 17.11. cmake

Possible arguments: (none), `insource`, `noninja`, `run`, `testing`

Use CMake for configuring the port and generating a build system.

By default an out-of-source build is performed, leaving the sources in `WRKSRC` free from build artifacts. With the `insource` argument, an in-source build will be performed instead. This argument should be an exception, used only when a regular out-of-source build does not work.

By default Ninja (`devel/ninja`) is used for the build. In some cases this does not work correctly. With the `noninja` argument, the build will use regular `make` for builds. This argument should only be used if a Ninja-based build does not work.

With the `run` argument, a run dependency is registered in addition to a build dependency.

With the `testing` argument, a test-target is added that uses CTest. When running tests the port will be re-configureed for testing and re-built.

For more information see [Using cmake](#).
17.12. compiler

Possible arguments: (none), env (default, implicit), {c-plus-plus}17-lang, {c-plus-plus}14-lang, {c-plus-plus}11-lang, gcc-{c-plus-plus}11-lib, {c-plus-plus}11-lib, {c-plus-plus}0x, c11, nestedfct, features

Determines which compiler to use based on any given wishes. Use {c-plus-plus}17-lang if the port needs a {c-plus-plus}17-capable compiler, {c-plus-plus}14-lang if the port needs a {c-plus-plus}14-capable compiler, {c-plus-plus}11-lang if the port needs a {c-plus-plus}11-capable compiler, gcc-{c-plus-plus}11-lib if the port needs the g++ compiler with a {c-plus-plus}11 library, or {c-plus-plus}11-lib if the port needs a {c-plus-plus}11-ready standard library. If the port needs a compiler understanding {c-plus-plus}0X, C11 or nested functions, the corresponding parameters should be used.

Use features to request a list of features supported by the default compiler. After including bsd.port.pre.mk the port can inspect the results using these variables:

- **COMPILER_TYPE**: the default compiler on the system, either gcc or clang
- **ALT_COMPILER_TYPE**: the alternative compiler on the system, either gcc or clang. Only set if two compilers are present in the base system.
- **COMPILER_VERSION**: the first two digits of the version of the default compiler.
- **ALT_COMPILER_VERSION**: the first two digits of the version of the alternative compiler, if present.
- **CHOSEN_COMPILER_TYPE**: the chosen compiler, either gcc or clang
- **COMPILER_FEATURES**: the features supported by the default compiler. It currently lists the {c-plus-plus} library.

17.13. cpe

Possible arguments: (none)

Include Common Platform Enumeration (CPE) information in package manifest as a CPE 2.3 formatted string. See the CPE specification for details. To add CPE information to a port, follow these steps:

1. Search for the official CPE entry for the software product either by using the NVD’s CPE search engine or in the official CPE dictionary (warning, very large XML file). Do not ever make up CPE data.
2. Add cpe to USES and compare the result of make -V CPE_STR to the CPE dictionary entry. Continue one step at a time until make -V CPE_STR is correct.
3. If the product name (second field, defaults to PORTNAME) is incorrect, define CPE_PRODUCT.
4. If the vendor name (first field, defaults to CPE_PRODUCT) is incorrect, define CPE_VENDOR.
5. If the version field (third field, defaults to PORTVERSION) is incorrect, define CPE_VERSION.
6. If the update field (fourth field, defaults to empty) is incorrect, define CPE_UPDATE.
7. If it is still not correct, check Mk/Uses/cpe.mk for additional details, or contact the Ports Security
8. Derive as much as possible of the CPE name from existing variables such as `PORTNAME` and `PORTVERSION`. Use variable modifiers to extract the relevant portions from these variables rather than hardcoding the name.

9. Always run `make -V CPE_STR` and check the output before committing anything that changes `PORTNAME` or `PORTVERSION` or any other variable which is used to derive `CPE_STR`.

17.14. **cran**

Possible arguments: (none), `auto-plist`, `compiles`

Uses the Comprehensive R Archive Network. Specify `auto-plist` to automatically generate pkg-plist. Specify `compiles` if the port has code that need to be compiled.

17.15. **desktop-file-utils**

Possible arguments: (none)

Uses `update-desktop-database` from `devel/desktop-file-utils`. An extra post-install step will be run without interfering with any post-install steps already in the port Makefile. A line with `@desktop-file-utils` will be added to the plist.

17.16. **desthack**

Possible arguments: (none)

Changes the behavior of GNU configure to properly support `DESTDIR` in case the original software does not.

17.17. **display**

Possible arguments: (none), `ARGS`

Set up a virtual display environment. If the environment variable `DISPLAY` is not set, then Xvfb is added as a build dependency, and `CONFIGURE_ENV` is extended with the port number of the currently running instance of Xvfb. The `ARGS` parameter defaults to `install` and controls the phase around which to start and stop the virtual display.

17.18. **dos2unix**

Possible arguments: (none)

The port has files with line endings in DOS format which need to be converted. Several variables can be set to control which files will be converted. The default is to convert all files, including binaries. See Simple Automatic Replacements for examples.

- **DOS2UNIX_REGEX**: match file names based on a regular expression.
• **DOS2UNIX_FILES**: match literal file names.

• **DOS2UNIX_GLOB**: match file names based on a glob pattern.

• **DOS2UNIX_WRKSRC**: the directory from which to start the conversions. Defaults to `${WRKSRC}`.

17.19. **drupal**

Possible arguments: 7, module, theme

Automate installation of a port that is a Drupal theme or module. Use with the version of Drupal that the port is expecting. For example, USES=drupal:7,module says that this port creates a Drupal 6 module. A Drupal 7 theme can be specified with USES=drupal:7,theme.

17.20. **eigen**

Possible arguments: 2, 3, build (default), run

Add dependency on math/eigen.

17.21. **fakeroot**

Possible arguments: (none)

Changes some default behavior of build systems to allow installing as a user. See https://wiki.debian.org/FakeRoot for more information on fakeroot.

17.22. **fam**

Possible arguments: (none), fam, gamin

Uses a File Alteration Monitor as a library dependency, either devel/fam or devel/gamin. End users can set WITH_FAM_SYSTEM to specify their preference.

17.23. **firebird**

Possible arguments: (none), 25

Add a dependency to the client library of the Firebird database.

17.24. **fonts**

Possible arguments: (none), fc, fcfontsdir (default), fontsdir, none

Adds a runtime dependency on tools needed to register fonts. Depending on the argument, add a @fc ${FONTSDIR} line, @fcfontsdir ${FONTSDIR} line, @fontsdir ${FONTSDIR} line, or no line if the argument is none, to the plist. FONTSDIR defaults to ${PREFIX}/share/fonts/${FONTNAME} and FONTNAME to ${PORTNAME}. Add FONTSDIR to PLIST_SUB and SUB_LIST.
17.25. **fortran**

Possible arguments: `gcc` (default)

Uses the GNU Fortran compiler.

17.26. **fuse**

Possible arguments: `2` (default), `3`

The port will depend on the FUSE library and handle the dependency on the kernel module depending on the version of FreeBSD.

17.27. **gem**

Possible arguments: (none), `noautoplisit`

Handle building with RubyGems. If `noautoplisit` is used, the packing list is not generated automatically.

17.28. **gettext**

Possible arguments: (none)

Deprecated. Will include both `gettext-runtime` and `gettext-tools`.

17.29. **gettext-runtime**

Possible arguments: (none), `lib` (default), `build`, `run`

Uses `devel/gettext-runtime`. By default, with no arguments or with the `lib` argument, implies a library dependency on `libintl.so`. `build` and `run` implies, respectively a build-time and a run-time dependency on `gettext`.

17.30. **gettext-tools**

Possible arguments: (none), `build` (default), `run`

Uses `devel/gettext-tools`. By default, with no argument, or with the `build` argument, a build time dependency on `msgfmt` is registered. With the `run` argument, a run-time dependency is registered.

17.31. **ghostscript**

Possible arguments: `X`, `build`, `run`, `nox11`

A specific version `X` can be used. Possible versions are `7`, `8`, `9`, and `agpl` (default). `nox11` indicates that the `-nox11` version of the port is required. `build` and `run` add build- and run-time dependencies on
Ghostscript. The default is both build- and run-time dependencies.

**17.32. gl**

Possible arguments: (none)

Provides an easy way to depend on GL components. The components should be listed in `USE_GL`. The available components are:

- **egl**
  - add a library dependency on `libEGL.so` from `graphics/libglvnd`

- **gbm**
  - Add a library dependency on `libgbm.so` from `graphics/mesa-libs`

- **gl**
  - Add a library dependency on `libGL.so` from `graphics/libglvnd`

- **glesv2**
  - Add a library dependency on `libGLESv2.so` from `graphics/libglvnd`

- **glew**
  - Add a library dependency on `libGLEW.so` from `graphics/glew`

- **glu**
  - Add a library dependency on `libGLU.so` from `graphics/libGLU`

- **glut**
  - Add a library dependency on `libglut.so` from `graphics/freeglut`

- **opengl**
  - Add a library dependency on `libOpenGL.so` from `graphics/libglvnd`

**17.33. gmake**

Possible arguments: (none)

Uses `devel/gmake` as a build-time dependency and sets up the environment to use `gmake` as the default `make` for the build.

**17.34. gnome**

Possible arguments: (none)

Provides an easy way to depend on GNOME components. The components should be listed in `USE_GNOME`. The available components are:

- **atk**
• atkmm
• cairo
• cairomm
• dconf
• esound
• evolutiondataserver3
• gconf2
• gconfmm26
• gdkpixbuf
• gdkpixbuf2
• glib12
• glib20
• glibmm
• gnomecontrolcenter3
• gnomedesktop3
• gnomedocutils
• gnomemenus3
• gnomemimedata
• gnomeprefix
• gnomesharp20
• gnomevfs2
• gsound
• gtk-update-icon-cache
• gtk12
• gtk20
• gtk30
• gtkhtml3
• gtkhtml4
• gtkmm20
• gtkmm24
• gtkmm30
• gtksharp20
• gtksourceview
• gtksourceview2
• gtksourceview3
• gtksourceviewmm3
• gvfs
• intlhack
• intlttool
• introspection
• libartlgpl2
• libbonobo
• libbonoboui
• libgda5
• libgda5-ui
• libgdamm5
• libglade2
• libgnome
• libgnomecanvas
• libgnomekbd
• libgnomeprint
• libgnomeprintui
• libgnomeui
• libgsf
• libgkhtml
• libgksourceviewmm
• libidl
• librsvg2
• libsigc++12
• libsigc++20
• libwnck
• libwnck3
• libxml++26
• libxml2
• libxs1t
• metacity
• nautilus3
• orbit2
• pango
• pango2mm
The default dependency is build- and run-time, it can be changed with :build or :run. For example:

```
USES= gnome
USE_GNOME= gnomemenus3:build intlhack
```

See Using GNOME for more information.

## 17.35. go

![Warning](https://assets.ubuntu.com/ports/ubuntu18.04/trusty لهجة الإنجليزية.png)

Ports should not be created for Go libs, see Go Libraries for more information.

### Possible arguments:

- (none), modules, no_targets, run

Sets default values and targets used to build Go software. A build dependency on the Go compiler port selected via GO_PORT is added. By default the build is performed in GOPATH mode. If Go software uses modules, the modules-aware mode can be switched on with modules argument. no_targets will setup build environment like GO_ENV, GO_BUILDFLAGS but skip creating post-extract and do-{build,install,test} targets. run will also add a run dependency on what is in GO_PORT.

The build process is controlled by several variables:

**GO_MODULE**

The name of the application module as specified by the module directive in go.mod. In most cases, this is the only required variable for ports that use Go modules.

**GO_PKGNAME**

The name of the Go package when building in GOPATH mode. This is the directory that will be created in ${GOPATH}/src. If not set explicitly and GH_SUBDIR or GL_SUBDIR is present, GO_PKGNAME will be inferred from it. It is not needed when building in modules-aware mode.

**GO_TARGET**

The packages to build. The default value is ${GO_PKGNAME}. GO_TARGET can also be a tuple in the form package:path where path can be either a simple filename or a full path starting with
GO_TESTTARGET
The packages to test. The default value is ./… (the current package and all subpackages).

CGO_CFLAGS
Additional CFLAGS values to be passed to the C compiler by go.

CGO_LDFLAGS
Additional LDFLAGS values to be passed to the C compiler by go.

GO_BUILDFLAGS
Additional build arguments to be passed to go build.

GO_TESTFLAGS
Additional build arguments to be passed to go test.

GO_PORT
The Go compiler port to use. By default this is lang/go but can be set to lang/go-devel in make.conf for testing with future Go versions.

⚠️ This variable must not be set by individual ports!

See Building Go Applications for usage examples.

17.36. gperf
Possible arguments: (none)

Add a buildtime dependency on devel/gperf if gperf is not present in the base system.

17.37. grantlee
Possible arguments: 5, selfbuild

Handle dependency on Grantlee. Specify 5 to depend on the Qt5 based version, devel/grantlee5. selfbuild is used internally by devel/grantlee5 to get their versions numbers.

17.38. groff
Possible arguments: build, run, both

Registers a dependency on textproc/groff if not present in the base system.

17.39. gssapi
Possible arguments: (none), base (default), heimdal, mit, flags, bootstrap
Handle dependencies needed by consumers of the GSS-API. Only libraries that provide the Kerberos mechanism are available. By default, or set to base, the GSS-API library from the base system is used. Can also be set to heimdal to use security/heimdal, or mit to use security/krb5.

When the local Kerberos installation is not in LOCALBASE, set HEIMDAL_HOME (for heimdal) or KR5_HOME (for krb5) to the location of the Kerberos installation.

These variables are exported for the ports to use:

- GSSAPIBASEDIR
- GSSAPICPPFLAGS
- GSSAPIINCDIR
- GSSAPILDFLAGS
- GSSAPILIBDIR
- GSSAPILIBS
- GSSAPI_CONFIGURE_ARGS

The flags option can be given alongside base, heimdal, or mit to automatically add GSSAPICPPFLAGS, GSSAPILDFLAGS, and GSSAPILIBS to CFLAGS, LDFLAGS, and LDADD, respectively. For example, use base,flags.

The bootstrap option is a special prefix only for use by security/krb5 and security/heimdal. For example, use bootstrap,mit.

**Example 116. Typical Use**

<table>
<thead>
<tr>
<th>OPTIONS_SINGLE= GSSAPI</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPTIONS_SINGLE_GSSAPI=  GSSAPI_BASE GSSAPI_HEIMDAL GSSAPI_MIT GSSAPI_NONE</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>GSSAPI_BASE_USES= gssapi</th>
</tr>
</thead>
<tbody>
<tr>
<td>GSSAPI_BASE_CONFIGURE_ON= --with-gssapi=${GSSAPIBASEDIR} ${GSSAPI_CONFIGURE_ARGS}</td>
</tr>
<tr>
<td>GSSAPI_HEIMDAL_USES= gssapi:heimdal</td>
</tr>
<tr>
<td>GSSAPI_HEIMDAL_CONFIGURE_ON= --with-gssapi=${GSSAPIBASEDIR} ${GSSAPI_CONFIGURE_ARGS}</td>
</tr>
<tr>
<td>GSSAPI_MIT_USES= gssapi:mit</td>
</tr>
<tr>
<td>GSSAPI_MIT_CONFIGURE_ON= --with-gssapi=${GSSAPIBASEDIR} ${GSSAPI_CONFIGURE_ARGS}</td>
</tr>
<tr>
<td>GSSAPI_NONE_CONFIGURE_ON= --without-gssapi</td>
</tr>
</tbody>
</table>

**17.40. horde**

Possible arguments: (none)

Add buildtime and runtime dependencies on devel/pear-channel-horde. Other Horde dependencies
can be added with `USE_HORDE_BUILD` and `USE_HORDE_RUN`. See Horde Modules for more information.

### 17.41. `iconv`

Possible arguments: (none), `lib`, `build`, `patch`, `translit`, `wchar_t`

Uses `iconv` functions, either from the port `converters/libiconv` as a build-time and run-time dependency, or from the base system. By default, with no arguments or with the `lib` argument, implies `iconv` with build-time and run-time dependencies. `build` implies a build-time dependency, and `patch` implies a patch-time dependency. If the port uses the `WCHAR_T` or `/TRANSLIT` `iconv` extensions, add the relevant arguments so that the correct `iconv` is used. For more information see Using `iconv`.

### 17.42. `imake`

Possible arguments: (none), `env`, `notall`, `noman`

Add `devel/imake` as a build-time dependency and run `xmkf -a` during the `configure` stage. If the `env` argument is given, the `configure` target is not set. If the `-a` flag is a problem for the port, add the `notall` argument. If `xmkf` does not generate a `install.man` target, add the `noman` argument.

### 17.43. `kde`

Possible arguments: `5`

Add dependency on KDE components. See Using KDE for more information.

### 17.44. `kmod`

Possible arguments: (none), `debug`

Fills in the boilerplate for kernel module ports, currently:

- Add `kld` to `CATEGORIES`.
- Set `SSP_UNSAFE`.
- Set `IGNORE` if the kernel sources are not found in `SRC_BASE`.
- Define `KMODDIR` to `/boot/modules` by default, add it to `PLIST_SUB` and `MAKE_ENV`, and create it upon installation. If `KMODDIR` is set to `/boot/kernel`, it will be rewritten to `/boot/modules`. This prevents breaking packages when upgrading the kernel due to `/boot/kernel` being renamed to `/boot/kernel.old` in the process.
- Handle cross-referencing kernel modules upon installation and deinstallation, using `@kld`.
- If the `debug` argument is given, the port can install a debug version of the module into `KERN_DEBUGDIR/KMODDIR`. By default, `KERN_DEBUGDIR` is copied from `DEBUGDIR` and set to `/usr/lib/debug`. The framework will take care of creating and removing any required directories.
17.45. lha

Possible arguments: (none)

Set `EXTRACT_SUFIX` to `.lzh`

17.46. libarchive

Possible arguments: (none)

Registers a dependency on `archivers/libarchive`. Any ports depending on libarchive must include `USES=libarchive`.

17.47. libedit

Possible arguments: (none)

Registers a dependency on `devel/libedit`. Any ports depending on libedit must include `USES=libedit`.

17.48. libtool

Possible arguments: (none), `keepla`, `build`

Patches `libtool` scripts. This must be added to all ports that use `libtool`. The `keepla` argument can be used to keep .la files. Some ports do not ship with their own copy of libtool and need a build time dependency on `devel/libtool`, use the `:build` argument to add such dependency.

17.49. linux

Possible arguments: `c6`, `c7`

Ports Linux compatibility framework. Specify `c6` to depend on CentOS 6 packages. Specify `c7` to depend on CentOS 7 packages. The available packages are:

- allegro
-alsa-plugins-oss
-alsa-plugins-pulseaudio
- alsalib
-atk
-avahi-libs
-base
-cairo
-cups-libs
-curl
• cyrus-sasl2
• dbusglib
• dbuslibs
• devtools
• dri
• expat
• flac
• fontconfig
• gdkpixbuf2
• gnutls
• graphite2
• gtk2
• harfbuzz
• jasper
• jbigkit
• jpeg
• libasyncns
• libaudiofile
• libelf
• libgcrypt
• libgfortran
• libgpg-error
• libmng
• libogg
• libpciaccess
•libsndfile
• libsoup
• libssh2
• libtasn1
• libthai
• libtheora
• libv4l
• libvorbis
• libxml2
• mikmod
• naslibs
• ncurses-base
• nspr
• nss
• openal
• openal-soft
• openldap
• openmotif
• openssl
• pango
• pixman
• png
• pulseaudio-libs
• qt
• qt-x11
• qtwebkit
• scimlibs
• sdl12
• sdlimage
• sdlmixer
• sqlite3
• tcl85
• tcp_wrappers-libs
• tiff
• tk85
• ucl
• xorglibs

17.50. localbase

Possible arguments: (none), ldflags

Ensures that libraries from dependencies in **LOCALBASE** are used instead of the ones from the base system. Specify **ldflags** to add `-L$LOCALBASE/lib` to **LDFLAGS** instead of **LIBS**. Ports that depend on libraries that are also present in the base system should use this. It is also used internally by a few other **USES**.
17.51. lua

Possible arguments: (none), XY, XY+, -XY, XY-ZA, module, flavors, build, run, env

Adds a dependency on Lua. By default this is a library dependency, unless overridden by the build and/or run option. The env option prevents the addition of any dependency, while still defining all the usual variables.

The default version is set by the usual DEFAULT_VERSIONS mechanism, unless a version or range of versions is specified as an argument, for example, 51 or 51-53.

Applications using Lua are normally built for only a single Lua version. However, library modules intended to be loaded by Lua code should use the module option to build with multiple flavors.

For more information see Using Lua.

17.52. lxqt

Possible arguments: (none)

Handle dependencies for the LXQt Desktop Environment. Use USE_LXQT to select the components needed for the port. See Using LXQt for more information.

17.53. makeinfo

Possible arguments: (none)

Add a build-time dependency on makeinfo if it is not present in the base system.

17.54. makeself

Possible arguments: (none)

Indicates that the distribution files are makeself archives and sets the appropriate dependencies.

17.55. mate

Possible arguments: (none)

Provides an easy way to depend on MATE components. The components should be listed in USE_MATE. The available components are:

- autogen
- caja
- common
- controlcenter
- desktop
• dialogs
• docutils
• icontheme
• intlhack
• intltool
• libmatekbd
• libmateweather
• marco
• menus
• notificationdaemon
• panel
• pluma
• polkit
• session
• settingsdaemon

The default dependency is build- and run-time, it can be changed with \texttt{:build} or \texttt{:run}. For example:

\begin{verbatim}
USES= mate
USE_MATE= menus:build intlhack
\end{verbatim}

17.56. \textbf{meson}

Possible arguments: (none)

Provide support for Meson based projects. For more information see Using meson.

17.57. \textbf{metaport}

Possible arguments: (none)

Sets the following variables to make it easier to create a metaport: MASTER_SITES, DISTFILES, EXTRACT_ONLY, NO_BUILD, NO_INSTALL, NO_MTREE, NO_ARCH.

17.58. \textbf{mysql}

Possible arguments: (none), version, client (default), server, embedded

Provide support for MySQL. If no version is given, try to find the current installed version. Fall back to the default version, MySQL-5.6. The possible versions are 55, 55m, 55p, 56, 56p, 56w, 57, 57p, 80, 100m, 101m, and 102m. The \texttt{m} and \texttt{p} suffixes are for the MariaDB and Percona variants of MySQL. server and
add a build- and run-time dependency on the MySQL server. When using server or embedded, add client to also add a dependency on libmysqlclient.so. A port can set IGNORE_WITH_MYSQL if some versions are not supported.

The framework sets MYSQL_VER to the detected MySQL version.

**17.59. mono**

Possible arguments: (none), nuget

Adds a dependency on the Mono (currently only C#) framework by setting the appropriate dependencies.

Specify nuget when the port uses nuget packages. NUGET_DEPENDS needs to be set with the names and versions of the nuget packages in the format name=version. An optional package origin can be added using name=version:_origin_:.

The helper target, buildnuget, will output the content of the NUGET_DEPENDS based on the provided packages.config.

**17.60. motif**

Possible arguments: (none)

Uses x11-toolkits/open-motif as a library dependency. End users can set WANT_LESTIF for the dependency to be on x11-toolkits/lesstif instead of x11-toolkits/open-motif.

**17.61. ncurses**

Possible arguments: (none), base, port

Uses ncurses, and causes some useful variables to be set.

**17.62. ninja**

Possible arguments: (none)

Uses ninja to build the port.

**17.63. objc**

Possible arguments: (none)

Add objective C dependencies (compiler, runtime library) if the base system does not support it.

**17.64. openal**

Possible arguments: al, soft (default), si, alut
Uses OpenAL. The backend can be specified, with the software implementation as the default. The user can specify a preferred backend with WANT_OPENAL. Valid values for this knob are soft (default) and si.

17.65. **pathfix**

Possible arguments: (none)

Look for Makefile.in and configure in PATHFIX_WRKSRC (defaults to WRKSRC) and fix common paths to make sure they respect the FreeBSD hierarchy. For example, it fixes the installation directory of pkgconfig’s .pc files to ${PREFIX}/libdata/pkgconfig. If the port uses ‘USES=autoreconf, Makefile.am will be added to PATHFIX_MAKEFILEIN automatically.

If the port USES=cmake it will look for CMakeLists.txt in PATHFIX_WRKSRC. If needed, that default filename can be changed with PATHFIX_CMAKELISTSTXT.

17.66. **pear**

Possible arguments: env

Adds a dependency on devel/pear. It will setup default behavior for software using the PHP Extension and Application Repository. Using the env arguments only sets up the PEAR environment variables. See PEAR Modules for more information.

17.67. **perl5**

Possible arguments: (none)

Depends on Perl. The configuration is done using USE_PERL5.

USE_PERL5 can contain the phases in which to use Perl, can be extract, patch, build, run, or test.

USE_PERL5 can also contain configure, modbuild, or modbuildtiny when Makefile.PL, Build.PL, or Module::Build::Tiny’s flavor of Build.PL is required.

USE_PERL5 defaults to build run. When using configure, modbuild, or modbuildtiny, build and run are implied.

See Using Perl for more information.

17.68. **pgsql**

Possible arguments: (none), X.Y, X.Y+, X.Y-, X.Y-Z.A

Provide support for PostgreSQL. Port maintainer can set version required. Minimum and maximum versions or a range can be specified; for example, 9.0-, 8.4+, 8.4-9.2.

By default, the added dependency will be the client, but if the port requires additional components, this can be done using WANT_PGSQL=component[:target]; for example, WANT_PGSQL=server:configure
pltcl  plperl. The available components are:

- client
- contrib
- docs
- pgtcl
- plperl
- plpython
- pltcl
- server

17.69. php

Possible arguments: (none), `phpize`, `ext`, `zend`, `build`, `cli`, `cgi`, `mod`, `web`, `embed`, `pecl`, `flavors`, `noflavors`

Provide support for PHP. Add a runtime dependency on the default PHP version, `lang/php56`.

- **phpize**
  Use to build a PHP extension. Enables flavors.

- **ext**
  Use to build, install and register a PHP extension. Enables flavors.

- **zend**
  Use to build, install and register a Zend extension. Enables flavors.

- **build**
  Set PHP also as a build-time dependency.

- **cli**
  Needs the CLI version of PHP.

- **cgi**
  Needs the CGI version of PHP.

- **mod**
  Needs the Apache module for PHP.

- **web**
  Needs the Apache module or the CGI version of PHP.

- **embed**
  Needs the embedded library version of PHP.

- **pecl**
  Provide defaults for fetching PHP extensions from the PECL repository. Enables flavors.
**flavors**

Enable automatic **PHP flavors** generation. Flavors will be generated for all PHP versions, except the ones present in **IGNORE_WITH_PHP**.

**noflavors**

Disable automatic PHP flavors generation. *Must only* be used with extensions provided by PHP itself.

Variables are used to specify which PHP modules are required, as well as which version of PHP are supported.

**USE_PHP**

The list of required PHP extensions at run-time. Add `:build` to the extension name to add a build-time dependency. Example: `pcre xml:build gettext`

**IGNORE_WITH_PHP**

The port does not work with PHP of the given version. For possible values look at the content of `_ALL_PHP_VERSIONS` in Mk/Uses/php.mk.

When building a PHP or Zend extension with `:ext` or `:zend`, these variables can be set:

**PHP_MODNAME**

The name of the PHP or Zend extension. Default value is `${PORTNAME}`.

**PHP_HEADER_DIRS**

A list of subdirectories from which to install header files. The framework will always install the header files that are present in the same directory as the extension.

**PHP_MOD_PRIO**

The priority at which to load the extension. It is a number between 00 and 99.

For extensions that do not depend on any extension, the priority is automatically set to 20, for extensions that depend on another extension, the priority is automatically set to 30. Some extensions may need to be loaded before every other extension, for example `www/php56-opcache`. Some may need to be loaded after an extension with a priority of 30. In that case, add `PHP_MOD_PRIO=XX` in the port's Makefile. For example:

```
USES= php:ext
USE_PHP= wddx
PHP_MOD_PRIO=40
```

These variables are available to use in **PKGNAMEPREFIX** or **PKGNAMESUFFIX**:

**PKGNAMEPREFIX**

Contains `php_XY_` where `XY` is the current flavor's PHP version. Use with PHP extensions and modules.
PHP_PKGNAMEPREFIX
Contains -php_XY_ where XY is the current flavor's PHP version. Use with PHP applications.

PECL_PKGNAMEPREFIX
Contains php_XY_-pecl- where XY is the current flavor's PHP version. Use with PECL modules.

With flavors, all PHP extensions, PECL extensions, PEAR modules must have a different package name, so they must all use one of these three variables in their PKGNAMEPREFIX or PKGNAMESUFFIX.

17.70. pkgconfig
Possible arguments: (none), build (default), run, both

Uses devel/pkgconf. With no arguments or with the build argument, it implies pkg-config as a build-time dependency. run implies a run-time dependency and both implies both run-time and build-time dependencies.

17.71. pure
Possible arguments: (none), ffi

Uses lang/pure. Largely used for building related pure ports. With the ffi argument, it implies devel/pure-ffi as a run-time dependency.

17.72. pyqt
Possible arguments: (none), 4, 5

Uses PyQt. If the port is part of PyQt itself, set PYQT_DIST. Use USE_PYQT to select the components the port needs. The available components are:

- core
- dbus
- dbussupport
- demo
- designer
- designerplugin
- doc
- gui
- multimedia
- network
- opengl
•.qscintilla2
• sip
• sql
• svg
• test
• webkit
• xml
• xmlpatterns

These components are only available with PyQt4:

• assistant
• declarative
• help
• phonon
• script
• scripttools

These components are only available with PyQt5:

• multimediawidgets
• printsupport
• qml
• serialport
• webkitwidgets
• widgets

The default dependency for each component is build- and run-time, to select only build or run, add _build or _run to the component name. For example:

```
USES=       pyqt
USE_PYQT=   core doc_build designer_run
```

17.73. python

Uses Python. A supported version or version range can be specified. If Python is only needed at build time, run time or for the tests, it can be set as a build, run or test dependency with build, run, or test. If Python is also needed during the patch phase, use patch. See Using Python for more information.
PYTHON_NO_DEPENDS=yes can be used when the variables exported by the framework are needed but a
dependency on Python is not. It can happen when using with USES=shebangfix, and the goal is only
to fix the shebangs but not add a dependency on Python.

17.74. qmail

Possible arguments: (none), build, run, both, vars

Uses mail/qmail. With the build argument, it implies qmail as a build-time dependency. run implies a
run-time dependency. Using no argument or the both argument implies both run-time and build-
time dependencies. vars will only set QMAIL variables for the port to use.

17.75. qmake

Possible arguments: (none), norecursive, outsource, no_env, no_configure

Uses QMake for configuring. For more information see Using qmake.

17.76. qt

Possible arguments: 5, no_env

Add dependency on Qt components. no_env is passed directly to USES= qmake. See Using Qt for more
information.

17.77. qt-dist

Possible arguments: (none) or 5 and (none) or one of 3d, activeqt, androidextras, base, canvas3d,
charts, connectivity, datavis3d, declarative, doc, gamepad, graphicaleffects, imageformats, location,
macextras, multimedia, networkauth, purchasing, quickcontrols2, quickcontrols, remoteobjects, script,
scxml, sensors, serialbus, serialport, speech, svg, tools, translations, virtualkeyboard, wayland,
webchannel, webengine, websockets, webview, winextras, x11extras, xmlpatterns

Provides support for building Qt 5 components. It takes care of setting up the appropriate
configuration environment for the port to build.

例 117. Building Qt 5 Components

The port is Qt 5's networkauth component, which is part of the networkauth distribution file.

<table>
<thead>
<tr>
<th>PORTNAME= networkauth</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISTVERSION= ${QT5_VERSION}</td>
</tr>
<tr>
<td>USES= qt-dist:5</td>
</tr>
</tbody>
</table>

If PORTNAME does not match the component name, it can be passed as an argument to qt-dist.
Example 118. Building Qt 5 Components with Different Names

The port is Qt 5’s gui component, which is part of the base distribution file.

```
PORTNAME= gui
DISTVERSION= ${QT5_VERSION}
USES= qt-dist:5,base
```

17.78. `readline`

Possible arguments: (none), `port`

Uses readline as a library dependency, and sets `CPPFLAGS` and `LDFLAGS` as necessary. If the `port` argument is used or if readline is not present in the base system, add a dependency on `devel/readline`.

17.79. `samba`

Possible arguments: `build`, `env`, `lib`, `run`

Handle dependency on Samba. `env` will not add any dependency and only set up the variables. `build` and `run` will add build-time and run-time dependency on smbd. `lib` will add a dependency on `libsmbclient.so`. The variables that are exported are:

- `SAMBAPORT`
  The origin of the default Samba port.

- `SAMBAINCLUDES`
  The location of the Samba header files.

- `SAMBALIBS`
  The directory where the Samba shared libraries are available.

17.80. `scons`

Possible arguments: (none)

Provide support for the use of `devel/scons`. See `Using scons` for more information.

17.81. `shared-mime-info`

Possible arguments: (none)

Uses `update-mime-database` from `misc/shared-mime-info`. This uses will automatically add a post-install step in such a way that the port itself still can specify there own post-install step if needed. It
also add an `@shared-mime-info` entry to the plist.

**17.82. shebangfix**

Possible arguments: (none)

A lot of software uses incorrect locations for script interpreters, most notably `/usr/bin/perl` and `/bin/bash`. The shebangfix macro fixes shebang lines in scripts listed in `SHEBANG_REGEX`, `SHEBANG_GLOB`, or `SHEBANG_FILES`.

**SHEBANG_REGEX**

Contains one extended regular expressions, and is used with the `-iregex` argument of `find(1)`. See `USES=shebangfix` with `SHEBANG_REGEX`.

**SHEBANG_GLOB**

Contains a list of patterns used with the `-name` argument of `find(1)`. See `USES=shebangfix` with `SHEBANG_GLOB`.

**SHEBANG_FILES**

Contains a list of files or `sh(1)` globs. The shebangfix macro is run from `${WRKSRC}`, so `SHEBANG_FILES` can contain paths that are relative to `${WRKSRC}`. It can also deal with absolute paths if files outside of `${WRKSRC}` require patching. See `USES=shebangfix` with `SHEBANG_FILES`.

Currently Bash, Java, Ksh, Lua, Perl, PHP, Python, Ruby, Tcl, and Tk are supported by default.

There are three configuration variables:

**SHEBANG_LANG**

The list of supported interpreters.

**_interp__CMD**

The path to the command interpreter on FreeBSD. The default value is `${LOCALBASE}/bin/interp`.

**_interp__OLD_CMD**

The list of wrong invocations of interpreters. These are typically obsolete paths, or paths used on other operating systems that are incorrect on FreeBSD. They will be replaced by the correct path in `_interp__CMD`.

These will *always* be part of`_interp__OLD_CMD`: 

```
"/usr/bin/env _interp"
/bin/interp /usr/bin/interp /usr/local/bin/interp.
```

`_interp__OLD_CMD` contain multiple values. Any entry with spaces must be quoted. See **Specifying all the Paths When Adding an Interpreter to USES=shebangfix**.
The fixing of shebangs is done during the patch phase. If scripts are created with incorrect shebangs during the build phase, the build process (for example, the configure script, or the Makefiles) must be patched or given the right path (for example, with CONFIGURE_ENV, CONFIGURE_ARGS, MAKE_ENV, or MAKE_ARGS) to generate the right shebangs.

Correct paths for supported interpreters are available in _interp__CMD.

When used with USES=python, and the aim is only to fix the shebangs but a dependency on Python itself is not wanted, use PYTHON_NO_DEPENDS=yes.

**Example 119. Adding Another Interpreter to USES=shebangfix**

To add another interpreter, set SHEBANG_LANG. For example:

```
SHEBANG_LANG= lua
```

**Example 120. Specifying all the Paths When Adding an Interpreter to USES=shebangfix**

If it was not already defined, and there were no default values for _interpOLD_CMD and _interpCMD the Ksh entry could be defined as:

```
SHEBANG_LANG= ksh
ksh_OLD_CMD= "/usr/bin/env ksh" /bin/ksh /usr/bin/ksh
ksh_CMD= ${LOCALBASE}/bin/ksh
```

**Example 121. Adding a Strange Location for an Interpreter**

Some software uses strange locations for an interpreter. For example, an application might expect Python to be located in /opt/bin/python2.7. The strange path to be replaced can be declared in the port Makefile:

```
python_OLD_CMD= /opt/bin/python2.7
```
**Example 122. USES=shebangfix with SHEBANG_REGEX**

To fix all the files in `${WRKSRC}/scripts` ending in .pl, .sh, or .cgi do:

```
USES=   shebangfix
SHEBANG_REGEX=  ./scripts/.*\.(sh|pl|cgi)
```

*SHEBANG_REGEX* is used by running `find -E`, which uses modern regular expressions also known as extended regular expressions. See `re_format(7)` for more information.

**Example 123. USES=shebangfix with SHEBANG_GLOB**

To fix all the files in `${WRKSRC}` ending in .pl or .sh, do:

```
USES=   shebangfix
SHEBANG_GLOB=   *.sh *.pl
```

**Example 124. USES=shebangfix with SHEBANG_FILES**

To fix the files `script/foobar.pl` and `script/*.sh` in `${WRKSRC}`, do:

```
USES=   shebangfix
SHEBANG_FILES=  scripts/foobar.pl scripts/*.sh
```

### 17.83. sqlite

Possible arguments: (none), 2, 3

Add a dependency on SQLite. The default version used is 3, but version 2 is also possible using the `:2` modifier.

### 17.84. ssl

Possible arguments: (none), build, run

Provide support for OpenSSL. A build- or run-time only dependency can be specified using `build` or `run`. These variables are available for the port's use, they are also added to `MAKE_ENV`:

**OPENSSLBASE**

Path to the OpenSSL installation base.
OPENSSLDIR
Path to OpenSSL’s configuration files.

OPENSSLLIB
Path to the OpenSSL libraries.

OPENSSLINC
Path to the OpenSSL includes.

OPENSSLRPATH
If defined, the path the linker needs to use to find the OpenSSL libraries.

If a port does not build with an OpenSSL flavor, set the BROKEN_SSL variable, and possibly the BROKEN_SSL_REASON__flavor__:

```
BROKEN_SSL= libressl
BROKEN_SSL_REASON_libressl= needs features only available in OpenSSL
```

17.85. tar

Possible arguments: (none), Z, bz2, bzip2, lzma, tbz, tbz2, tgz, txz, xz

Set EXTRACT_SUFX to .tar, .tar.Z, .tar.bz2, .tar.bz2, .tar.lzma, .tbz, .tbz2, .tgz, .txz or .tar.xz respectively.

17.86. tcl

Possible arguments: version, wrapper, build, run, tea

Add a dependency on Tcl. A specific version can be requested using version. The version can be empty, one or more exact version numbers (currently 84, 85, or 86), or a minimal version number (currently 84+, 85+ or 86+). To only request a non version specific wrapper, use wrapper. A build- or run-time only dependency can be specified using build or run. To build the port using the Tcl Extension Architecture, use tea. After including bsd.port.pre.mk the port can inspect the results using these variables:

- TCL_VER: chosen major.minor version of Tcl
- TCLSH: full path of the Tcl interpreter
- TCL_LIBDIR: path of the Tcl libraries
- TCL_INCLUDEDIR: path of the Tcl C header files
- TK_VER: chosen major.minor version of Tk
- WISH: full path of the Tk interpreter
- TK_LIBDIR: path of the Tk libraries
- TK_INCLUDEDIR: path of the Tk C header files
17.87. **terminfo**

Possible arguments: (none)

Adds `@terminfo` to the plist. Use when the port installs *.terminfo files in ${PREFIX}/share/misc.

17.88. **tk**

Same as arguments for tcl

Small wrapper when using both Tcl and Tk. The same variables are returned as when using Tcl.

17.89. **uidfix**

Possible arguments: (none)

Changes some default behavior (mostly variables) of the build system to allow installing this port as a normal user. Try this in the port before using `USES=fakeroot` or patching.

17.90. **uniquefiles**

Possible arguments: (none), dirs

Make files or directories 'unique', by adding a prefix or suffix. If the dirs argument is used, the port needs a prefix (and only a prefix) based on `UNIQUE_PREFIX` for standard directories `DOCSDIR`, `EXAMPLESDIR`, `DATADIR`, `WWWDIR`, `ETCDIR`. These variables are available for ports:

- `UNIQUE_PREFIX`: The prefix to be used for directories and files. Default: `${PKGNAMEPREFIX}`.
- `UNIQUE_PREFIX_FILES`: A list of files that need to be prefixed. Default: empty.
- `UNIQUE_SUFFIX`: The suffix to be used for files. Default: `${PKGNAMESUFFIX}`.
- `UNIQUE_SUFFIX_FILES`: A list of files that need to be suffixed. Default: empty.

17.91. **varnish**

Possible arguments: 4, 6

Handle dependencies on Varnish Cache. 4 will add a dependency on `www/varnish4`. 6 will add a dependency on `www/varnish6`.

17.92. **webplugin**

Possible arguments: (none), ARGS

Automatically create and remove symbolic links for each application that supports the webplugin framework. ARGS can be one of:

- `gecko`: support plug-ins based on Gecko
• **native**: support plug-ins for Gecko, Opera, and WebKit-GTK
• **linux**: support Linux plug-ins
• **all** (default, implicit): support all plug-in types
• (individual entries): support only the browsers listed

These variables can be adjusted:

• **WEBPLUGIN_FILES**: No default, must be set manually. The plug-in files to install.
• **WEBPLUGIN_DIR**: The directory to install the plug-in files to, default `PREFIX/lib/browser_plugins/WEBPLUGIN_NAME`. Set this if the port installs plug-in files outside of the default directory to prevent broken symbolic links.
• **WEBPLUGIN_NAME**: The final directory to install the plug-in files into, default `PKGBASE`.

### 17.93. xfce

Possible arguments: (none), `gtk2`

Provide support for Xfce related ports. See Using Xfce for details.

The `gtk2` argument specifies that the port requires GTK2 support. It adds additional features provided by some core components, for example, `x11/libxfce4menu` and `x11-wm/xfce4-panel`.

### 17.94. xorg

Possible arguments: (none)

Provides an easy way to depend on X.org components. The components should be listed in `USE_XORG`. The available components are:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dmx</td>
<td>DMX extension library</td>
</tr>
<tr>

</tr>
</tbody>
</table>
### xorg-cat

Possible arguments: `app, data, doc, driver, font, lib, proto, util, xserver` and (none) or one off `autotools` (default), `meson`

Provide support for building Xorg components. It takes care of setting up common dependencies and an appropriate configuration environment needed. This is intended only for Xorg components.

The category has to match upstream categories.

The second argument is the build system to use. autotools is the default, but meson is also supported.

### zip

Possible arguments: (none), `infozip`

Indicates that the distribution files use the ZIP compression algorithm. For files using the InfoZip algorithm the `infozip` argument must be passed to set the appropriate dependencies.
# Chapter 18. `__FreeBSD_version` Values

Here is a convenient list of `__FreeBSD_version` values as defined in `sys/param.h`:

## 18.1. FreeBSD 14 Versions

<table>
<thead>
<tr>
<th>Value</th>
<th>Revision</th>
<th>Date</th>
<th>Release</th>
</tr>
</thead>
<tbody>
<tr>
<td>1400000</td>
<td>a53ce3fc4938</td>
<td>January 22, 2021</td>
<td>14.0-CURRENT.</td>
</tr>
<tr>
<td>1400001</td>
<td>739ecb6f1c4f</td>
<td>January 23, 2021</td>
<td>14.0-CURRENT after adding symlink support to lockless lookup.</td>
</tr>
<tr>
<td>1400002</td>
<td>2cf84258922f</td>
<td>January 26, 2021</td>
<td>14.0-CURRENT after fixing a clang assertion when building the <code>devel/onetbb</code> port.</td>
</tr>
<tr>
<td>1400003</td>
<td>d386f3a3c32f</td>
<td>January 28, 2021</td>
<td>14.0-CURRENT after adding various LinuxKPI bits conflicting with drm-kmod.</td>
</tr>
<tr>
<td>1400004</td>
<td>68f6800ce05c</td>
<td>February 8, 2021</td>
<td>14.0-CURRENT after kernel interfaces for dispatching cryptographic operations were changed.</td>
</tr>
<tr>
<td>1400005</td>
<td>45eabf5754ac</td>

<td>2.2-STABLE after 2.2.8-RELEASE</td>
</tr>
</tbody>
</table>
Note that 2.2-STABLE sometimes identifies itself as "2.2.5-STABLE" after the 2.2.5-RELEASE. The pattern used to be year followed by the month, but we decided to change it to a more straightforward major/minor system starting from 2.2. This is because the parallel development on several branches made it infeasible to classify the releases merely by their real release dates. Do not worry about old -CURRENTs; they are listed here just for reference.
